1 Deprecated List

Global GSS_C_GLOBUS_ACCEPT_PROXY_SIGNED_BY_LIMITED_PROXY_FLAG (p. **6**)

We now accept proxies signed by limited proxies if they are limited or independent.

Global GSS_C_GLOBUS_LIMITED_PROXY_MANY_FLAG (p. **7**)

We now accept proxies signed by limited proxies if they are limited or independent.

2 Module Index

2.1 Modules

Here is a list of all modules:

3 Module Documentation

3.1 Functions for manipulating a buffer set

3.2 GSI GSS-API Constants

3.3 Activation

Defines

- #define **GLOBUS_GSI_GSSAPI_MODULE**

3.3.1 Detailed Description

Globus GSI GSSAPI uses standard Globus module activation and deactivation. Before any Globus GSI GSSAPI functions are called, the following function should be called:

```
globus_module_activate(GLOBUS_GSI_GSSAPI_MODULE)
```

This function returns GLOBUS_SUCCESS if Globus GSI GSSAPI was successfully initialized, and you are therefore allowed to subsequently call Globus GSI GSSAPI functions. Otherwise, an error code is returned, and Globus GSI GSSAPI functions should not subsequently be called. This function may be called multiple times.

To deactivate Globus GSI GSSAPI, the following function should be called:

```
globus_module_deactivate(GLOBUS_GSI_GSSAPI_MODULE)
```

This function should be called once for each time Globus GSI GSSAPI was activated.

Note that it is not mandatory to call the above functions.

3.3.2 Define Documentation

3.3.2.1 #define GLOBUS_GSI_GSSAPI_MODULE

Module descriptor.

3.4 GSS Req Flags

Collaboration diagram for GSS Req Flags:

Modules

- **GSS Ret Flags**

Defines

- #define **GSS_C_GLOBUS_DONT_ACCEPT_LIMITED_PROXY_FLAG** 8192
- #define **GSS_C_GLOBUS_DELEGATE_LIMITED_PROXY_FLAG** 4096
- #define **GSS_C_GLOBUS_ACCEPT_PROXY_SIGNED_BY_LIMITED_PROXY_FLAG** 32768
- #define **GSS_C_GLOBUS_ALLOW_MISSING_SIGNING_POLICY** 65536

- OM_uint32 **gss_inquire_cred_by_oid** (OM_uint32 *, const gss_cred_id_t, const gss_OID, gss_buffer_set_t *)
- OM_uint32 **gss_set_sec_context_option** (OM_uint32 *, gss_ctx_id_t *, const gss_OID, const gss_buffer_t)

3.4.1 Detailed Description

These macros set the REQUESTED type of context - these should be set (or not) in the context's req_flags (or in the context's ret_flags if accept_sec_context is being called)

3.4.2 Define Documentation

3.4.2.1 #define GSS_C_GLOBUS_DONT_ACCEPT_LIMITED_PROXY_FLAG 8192

Set if you don't want a context to accept a limited proxy.

If this flag is set, and a limited proxy is received, the call will not be successful and the context will not be set up

3.4.2.2 #define GSS_C_GLOBUS_DELEGATE_LIMITED_PROXY_FLAG 4096

Set if you wan the delegated proxy to be a limited proxy.

3.4.2.3 #define GSS_C_GLOBUS_ACCEPT_PROXY_SIGNED_BY_LIMITED_PROXY_FLAG 32768

Set if you want to accept proxies signed by limited proxies.

Deprecated We now accept proxies signed by limited proxies if they are limited or independent.

3.4.2.4 #define GSS_C_GLOBUS_ALLOW_MISSING_SIGNING_POLICY 65536

Set if you want to allow CA certs without a signing policy to verify.

3.4.2.5 #define GSS_C_GLOBUS_FORCE_SSL3 131072

Set if you want to force SSLv3 instead of negotiating TLSv1 or SSLv3.

3.4.2.6 #define GSS_C_GLOBUS_LIMITED_PROXY_MANY_FLAG 32768

Deprecated We now accept proxies signed by limited proxies if they are limited or independent.

3.4.3 Function Documentation

3.4.3.1 OM_uint32 gss_acquire_cred (OM_uint32 * *minor_status,* const gss_name_t *desired_name_P,* OM_uint32 *time_req,* const gss_OID_set *desired_mechs,* gss_cred_usage_t *cred_usage,* gss_cred_id_t * *output_cred_handle_P,* gss_OID_set * *actual_mechs,* OM_uint32 * *time_rec*)

GSSAPI routine to acquire the local credential.

See the latest IETF draft/RFC on the GSS C bindings.

Gets the local credentials. The proxy_init_cred does most of the work of setting up the SSL_ctx, getting the user's cert, key, etc.

The globusid will be obtained from the certificate. (Minus and /CN=proxy entries.)

Parameters

minor_status	Mechanism specific status code. In this implementation, the minor_status is a cast from a globus_result_t value, which is either GLOBUS_SUCCESS or a globus error object ID if an error occurred.
desired_name_P	Name of principle whose credentials should be acquired This parameter maps to the desired subject of the cert to be acquired as the credential. Possible values are: For a service cert: <service name>=""><fqdn> For a host cert: <fqdn> For a proxy cert: <subject name>=""> For a user cert: <subject name>=""> This parameter can be NULL, in which case the cert is chosen using a default search order of: host, proxy, user, service
time_req	Number of seconds that credentials should remain valid. This value can be GSS_C_INDEFINITE for an unlimited lifetime. NOTE: in the current implementation, this parameter is ignored, since you can't change the expiration of a signed cert.
desired_mechs	
cred_usage	
output_cred_handle_P	
actual_mechs	
time_rec	

3.4.3.2 OM_uint32 gss_release_cred (OM_uint32 * *minor_status,* gss_cred_id_t * *cred_handle_P*)

Release the GSS cred handle.

Parameters

minor_status	The minor status result - this is a globus_result_t cast to a OM_uint32. To access the globus error object use: globus_error_get((globus_result_t) *minor_status)
cred_handle_P	The gss cred handle to be released

Returns

The major status - GSS_S_COMPLETE or GSS_S_FAILURE

3.4.3.3 OM_uint32 gss_accept_sec_context (OM_uint32 * *minor_status,* gss_ctx_id_t * *context_handle_P,* const gss_cred_id_t *acceptor_cred_handle,* const gss_buffer_t *input_token,* const gss_channel_bindings_t *input_chan_bindings,* gss_name_t * *src_name_P,* gss_OID * *mech_type,* gss_buffer_t *output_token,* OM_uint32 * *ret_flags,* OM_uint32 * *time_rec,* gss_cred_id_t * *delegated_cred_handle_P*)

Parameters

minor_status	
context_handle_P	
acceptor_cred_handle	
input_token	
input_chan_bindings	
src_name_P	
mech_type	
output_token	
ret_flags	Also used as req_flags for other functions
time_rec	
delegated_cred_handle_P	

Returns

3.4.3.4 OM_uint32 gss_delete_sec_context (OM_uint32 * *minor_status,* gss_ctx_id_t * *context_handle_P,* gss_buffer_t *output_token*)

Delete the GSS Security Context.

Parameters

minor_status	The minor status result - this is a globus_result_t cast to a OM_uint32. The
context_handle_P	The context handle to be deleted
output_token	The

3.4.3.5 OM_uint32 gss_context_time (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* OM_uint32 * *time_rec*)

Parameters

minor_status	
context_handle	
time_rec	

Returns

3.4.3.6 OM_uint32 gss_get_mic (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* gss_qop_t *qop_req,* const gss_buffer_t *message_buffer,* gss_buffer_t *message_token*)

Calculates a cryptographic MIC (message integrity check) over an application message, and returns that MIC in the token.

The token and message can then be passed to the peer application which calls **gss_verify_mic** (p. 9) to verify the MIC.

Parameters

minor_status	
context_handle	
qop_req	
message_buffer	
message_token	

Returns

3.4.3.7 OM_uint32 gss_verify_mic (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* const gss_buffer_t *message_buffer,* const gss_buffer_t *token_buffer,* gss_qop_t * *qop_state*)

Check a MIC of the data.

Parameters

minor_status	
context_handle	
message_buffer	
token_buffer	
qop_state	

Returns

3.4.3.8 OM_uint32 gss_wrap (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* int *conf_req_flag,* gss_qop_t *qop_req,* const gss_buffer_t *input_message_buffer,* int * *conf_state,* gss_buffer_t *output_message_buffer*)

Wrap a message for integretry and protection.

We do this using the SSLv3 routines, by writing to the SSL bio, and pulling off the buffer from the back of the write BIO. But we can't do everything SSL might want, such as control messages, or segment the messages here, since we are forced to using the gssapi tokens, and can not communicate directly with our peer. So there maybe some failures which would work with true SSL.

Parameters

minor_status	
context_handle	
conf_req_flag	
qop_req	
input_message-_buffer	
conf_state	

output_message_buffer	

Returns

3.4.3.9 OM_uint32 gss_unwrap (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* const gss_buffer_t *input_message_buffer,* gss_buffer_t *output_message_buffer,* int * *conf_state,* gss_qop_t * *qop_state*)

GSSAPI routine to unwrap a buffer which may have been received and wraped by wrap.c.

Return the data from the wrapped buffer. There may also be errors, such as integraty errors. Since we can not communicate directly with our peer, we can not do everything SSL could, i.e. return a token for example.

Parameters

minor_status	
context_handle	
input_message_buffer	
output_message_buffer	
conf_state	
qop_state	

Returns

3.4.3.10 OM_uint32 gss_display_status (OM_uint32 * *minor_status,* OM_uint32 *status_value,* int *status_type,* const gss_OID *mech_type,* OM_uint32 * *message_context,* gss_buffer_t *status_string*)

Calls the SSLeay error print routines to produce a printable message.

This may need some work, as the SSLeay error messages are more of a trace, and my not be the best for the user. Also don't take advantage of being called in a loop.

Parameters

minor_status	
status_value	
status_type	
mech_type	
message_context	
status_string	

Returns

3.4.3.11 OM_uint32 gss_indicate_mechs (OM_uint32 * *minor_status,* gss_OID_set * *mech_set*)

Passes back the mech set of available mechs.

We only have one for now.

Parameters

minor_status	
mech_set	

Returns

3.4.3.12 OM_uint32 gss_compare_name (OM_uint32 * *minor_status,* const gss_name_t *name1_P,* const gss_name_t *name2_P,* int * *name_equal*)

Compare two names.

GSSAPI names in this implementation are pointers to x509 names.

Parameters

minor_status	currently is always set to GLOBUS_SUCCESS
name1_P	
name2_P	
name_equal	

Returns

currently always returns GSS_S_COMPLETE

3.4.3.13 OM_uint32 gss_import_name (OM_uint32 * *minor_status,* const gss_buffer_t *input_name_buffer,* const gss_OID *input_name_type,* gss_name_t * *output_name_P*)

Import a name into a gss_name_t

Creates a new gss_name_t which contains a mechanism-specific representation of the input name.

GSSAPI OpenSSL implements the following name types, based on the input_name_type OID:

- GSS_C_NT_ANONYMOUS (input_name_buffer is ignored)
- GSS_C_NT_HOSTBASED_SERVICE (input_name_buffer contains a string "service@FQN" which will match /CN=service/FQDN)
- GSS_C_NT_EXPORT_NAME (input_name_buffer contains a string with the X509_oneline representation of a name) like "/X=Y/Z=A...")
- GSS_C_NO_OID or GSS_C_NT_USER_NAME (input_name_buffer contains an X.500 name formatted like "/X=Y/Z=A...")
- GLOBUS_GSS_C_NT_HOST_IP (input_name_buffer contains a string "FQDN/ip-address" which will match names with the FQDN or the IP address)
- GLOBUS_SSS_C_NT_X509 (input buffer is an X509 struct from OpenSSL)

Parameters

minor_status	Minor status
input_name_buffer	Input name buffer which is interpreted based on the *input_name_type*
input_name_type	OID of the name
output_name_P	New gss_name_t value containing the name

Return values

GSS_S_COMPLETE	indicates that a valid name representation is output in output_name and described by the type value in output_name_type.
GSS_S_BAD_NAMETYPE	indicates that the input_name_type is unsupported by the applicable underlying GSS-API mechanism(s), so the import operation could not be completed.
GSS_S_BAD_NAME	indicates that the provided input_name_string is ill-formed in terms of the input_name_type, so the import operation could not be completed.
GSS_S_BAD_MECH	indicates that the input presented for import was an exported name object and that its enclosed mechanism type was not recognized or was unsupported by the GSS-API implementation.
GSS_S_FAILURE	indicates that the requested operation could not be performed for reasons unspecified at the GSS-API level.

3.4.3.14 OM_uint32 gss_export_name (OM_uint32 * *minor_status,* const gss_name_t *input_name_P,* gss_buffer_t *exported_name*)

Produces a mechanism-independent exported name object.

See section 3.2 of RFC 2743.

3.4.3.15 OM_uint32 gss_release_name (OM_uint32 * *minor_status,* gss_name_t * *name_P*)

Release the GSS Name.

Parameters

minor_status	The minor status result - this is a globus_result_t cast to a (OM_uint32 *).
name_P	The gss name to be released

Returns

The major status - GSS_S_COMPLETE or GSS_S_FAILURE

3.4.3.16 OM_uint32 gss_release_buffer (OM_uint32 * *minor_status,* gss_buffer_t *buffer*)

Parameters

minor_status	
buffer	

Returns

3.4.3.17 OM_uint32 gss_release_oid_set (OM_uint32 * *minor_status,* gss_OID_set * *mech_set*)

Release the OID set.

Parameters

minor_status	
mech_set	

Returns

3.4.3.18 OM_uint32 gss_inquire_cred (OM_uint32 * *minor_status,* const gss_cred_id_t *cred_handle_P,* gss_name_t * *name,* OM_uint32 * *lifetime,* gss_cred_usage_t * *cred_usage,* gss_OID_set * *mechanisms*)

Get information about the current credential.

We will also allow the return of the proxy file name, if the minor_status is set to a value of 57056 0xdee0 This is done since there is no way to pass back the delegated credential file name.

When 57056 is seen, this will cause a new copy of this credential to be written, and it is the user's responsibility to free the file when done. The name will be a pointer to a char * of the file name which must be freeed. The minor_status will be set to 57057 0xdee1 to indicate this.

DEE - this is a kludge, till the GSSAPI get a better way to return the name.

If the minor status is not changed from 57056 to 57057 assume it is not this gssapi, and a gss name was returned.

Parameters

minor_status	
cred_handle_P	
name	
lifetime	
cred_usage	
mechanisms	

Returns

3.4.3.19 OM_uint32 gss_inquire_context (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle_P,* gss_name_t * *src_name_P,* gss_name_t * *targ_name_P,* OM_uint32 * *lifetime_rec,* gss_OID * *mech_type,* OM_uint32 * *ctx_flags,* int * *locally_initiated,* int * *open*)

Parameters

minor_status	
context_handle_P	
src_name_P	
targ_name_P	
lifetime_rec	
mech_type	
ctx_flags	
locally_initiated	
open	

Returns

3.4.3.20 OM_uint32 gss_wrap_size_limit (OM_uint32 * *minor_status*, const gss_ctx_id_t *context_handle*, int *conf_req_flag*, gss_qop_t *qop_req*, OM_uint32 *req_output_size*, OM_uint32 * *max_input_size*)

GSSAPI routine to take a buffer, calculate a MIC which is returned as a token.

We will use the SSL protocol here.

Parameters

minor_status	
context_handle	
conf_req_flag	
qop_req	
req_output_size	
max_input_size	

Returns

3.4.3.21 OM_uint32 gss_export_sec_context (OM_uint32 * *minor_status*, gss_ctx_id_t * *context_handle_P*, gss_buffer_t *interprocess_token*)

Saves the important info about the session, converts it to a token, then deletes the context.

Parameters

minor_status	
context_handle_P	
interprocess_token	

Returns

For SSL handle We need to save: version of this routine. cred_usage, i.e. are we accept or initiate target/source or name Session: Protocol, cipher, and Master-Key Client-Random Server-Random tmp.key_block: client and server Mac_secrets write_sequence read_sequence write iv read iv

see SSL 3.0 draft `http://wp.netscape.com/eng/ssl3/index.html`

3.4.3.22 OM_uint32 gss_import_sec_context (OM_uint32 * *minor_status*, const gss_buffer_t *interprocess_token*, gss_ctx_id_t * *context_handle_P*)

GSSAPI routine to import the security context based on the input token.

See: <draft-ietf-cat-gssv2-cbind-04.txt>

3.4.3.23 OM_uint32 gss_create_empty_oid_set (OM_uint32 * *minor_status*, gss_OID_set * *oid_set*)

Creates an object identifier set containing no object identifiers, to which members may be subsequently added using the GSS_Add_OID_set_member() routine.

These routines are intended to be used to construct sets of mechanism object identifiers, for input to GSS_Acquire-_cred().

Parameters

minor_status	
oid_set	

Returns

GSS_S_COMPLETE indicates successful completion GSS_S_FAILURE indicates that the operation failed

3.4.3.24 OM_uint32 gss_add_oid_set_member (OM_uint32 * *minor_status,* const gss_OID *member_oid,* gss_OID_set * *oid_set*)

Adds an Object Identifier to an Object Identifier set.

This routine is intended for use in conjunction with GSS_Create_empty_OID_set() when constructing a set of mechanism OIDs for input to GSS_Acquire_cred().

Parameters

minor_status	
member_oid	
oid_set	

Returns

GSS_S_COMPLETE indicates successful completion GSS_S_FAILURE indicates that the operation failed

3.4.3.25 OM_uint32 gss_test_oid_set_member (OM_uint32 * *minor_status,* const gss_OID *member,* const gss_OID_set *set,* int * *present*)

Interrogates an Object Identifier set to determine whether a specified Object Identifier is a member.

This routine is intended to be used with OID sets returned by GSS_Indicate_mechs(), GSS_Acquire_cred(), and GSS_Inquire_cred().

Parameters

minor_status	
member	
set	
present	

Returns

GSS_S_COMPLETE indicates successful completion GSS_S_FAILURE indicates that the operation failed

3.4.3.26 OM_uint32 gss_duplicate_name (OM_uint32 * *minor_status,* const gss_name_t *src_name,* gss_name_t * *dest_name*)

Copy a GSS name.

Parameters

minor_status	
src_name	
dest_name	

Returns

3.4.3.27 OM_uint32 gss_sign (OM_uint32 * *minor_status*, gss_ctx_id_t *context_handle*, int *qop_req*, gss_buffer_t *message_buffer*, gss_buffer_t *message_token*)

Deprecated.

Does the same thing as gss_get_mic for V1 compatability.

Parameters

minor_status	
context_handle	
qop_req	
message_buffer	
message_token	

Returns

3.4.3.28 OM_uint32 gss_verify (OM_uint32 * *minor_status*, gss_ctx_id_t *context_handle*, gss_buffer_t *message_buffer*, gss_buffer_t *token_buffer*, int * *qop_state*)

Obsolete variant of gss_verify for V1 compatability Check a MIC of the date.

Parameters

minor_status	
context_handle	
massage_buffer	
token_buffer	
qop_state	

Returns

3.4.3.29 OM_uint32 gss_unseal (OM_uint32 * *minor_status*, gss_ctx_id_t *context_handle*, gss_buffer_t *input_message_buffer*, gss_buffer_t *output_message_buffer*, int * *conf_state*, int * *qop_state*)

Obsolete variant of gss_wrap for V1 compatability allow for non 32 bit integer in qop_state.

Return the data from the wrapped buffer. There may also be errors, such as integraty errors. Since we can not communicate directly with our peer, we can not do everything SSL could, i.e. return a token for example.

Parameters

minor_status	
context_handle	
input_message-_buffer	
output_-message_buffer	
conf_state	
qop_state	

Returns

3.4.3.30 OM_uint32 gss_create_empty_buffer_set (OM_uint32 * *minor_status*, gss_buffer_set_t * *buffer_set*)

Create a empty buffer set.

This function allocates and initializes a empty buffer set. The memory allocated in this function should be freed by a call to gss_release_buffer_set.

Parameters

minor_status	The minor status returned by this function. This paramter will be 0 upon success.
buffer_set	Pointer to a buffer set structure.

Returns

GSS_S_COMPLETE upon success GSS_S_FAILURE failure

See also

gss_add_buffer_set_member (p. 17)
gss_release_buffer_set (p. 18)

3.4.3.31 OM_uint32 gss_add_buffer_set_member (OM_uint32 * *minor_status*, const gss_buffer_t *member_buffer*, gss_buffer_set_t * *buffer_set*)

Add a buffer to a buffer set.

This function allocates a new gss_buffer_t, intializes it with the values in the member_buffer parameter.

Parameters

minor_status	The minor status returned by this function. This paramter will be 0 upon success.
member_buffer	Buffer to insert into the buffer set.
buffer_set	Pointer to a initialized buffer set structure.

Returns

GSS_S_COMPLETE upon success GSS_S_FAILURE failure

See also

gss_create_empty_buffer_set (p. 17)
gss_release_buffer_set (p. 18)

3.4.3.32 OM_uint32 gss_release_buffer_set (OM_uint32 * *minor_status*, gss_buffer_set_t * *buffer_set*)

Free all memory associated with a buffer set.

This function will free all memory associated with a buffer set. Note that it will also free all memory associated with the buffers int the buffer set.

Parameters

minor_status	The minor status returned by this function. This paramter will be 0 upon success.
buffer_set	Pointer to a buffer set structure. This pointer will point at a NULL value upon return.

Returns

GSS_S_COMPLETE upon success GSS_S_FAILURE failure

See also

gss_create_empty_buffer_set (p. 17)
gss_add_buffer_set_member (p. 17)

3.4.3.33 OM_uint32 gss_import_cred (OM_uint32 * *minor_status*, gss_cred_id_t * *output_cred_handle*, const gss_OID *desired_mech*, OM_uint32 *option_req*, const gss_buffer_t *import_buffer*, OM_uint32 *time_req*, OM_uint32 * *time_rec*)

Import a credential that was exported by **gss_export_cred()** (p. 18).

This function will import credentials exported by **gss_export_cred()** (p. 18). It is intended to allow a multiple use application to checkpoint delegated credentials.

Parameters

minor_status	The minor status returned by this function. This paramter will be 0 upon success.
output_cred_handle	Upon success, this paramter will contain the imported credential. When no longer needed this credential should be freed using **gss_release_cred()** (p. 7).
desired_mech	This paramter may be used to specify the desired security mechanism. May be GSS_C_NO_OID.
option_req	This paramater indicates which option_req value was used to produce the import_buffer.
import_buffer	A buffer produced by gss_export_credential().
time_req	The requested period of validity (seconds) for the imported credential. May be NULL.
time_rec	This parameter will contain the received period of validity of the imported credential upon success. May be NULL.

Returns

GSS_S_COMPLETE upon successful completion GSS_S_BAD_MECH if the requested security mechanism is unavailable GSS_S_DEFECTIVE_TOKEN if the import_buffer is defective GSS_S_FAILURE upon general failure

3.4.3.34 OM_uint32 gss_export_cred (OM_uint32 * *minor_status*, const gss_cred_id_t *cred_handle*, const gss_OID *desired_mech*, OM_uint32 *option_req*, gss_buffer_t *export_buffer*)

Saves the credential so it can be checkpointed and imported by gss_import_cred.

Parameters

minor_status	
cred_handle	
desired_mech	Should either be gss_mech_globus_gssapi_openssl or NULL (in which case gss_mech_globus_gssapi_openssl is assumed).
option_req	
export_buffer	

Returns

3.4.3.35 OM_uint32 gss_init_delegation (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* const gss_cred_id_t *cred_handle,* const gss_OID *desired_mech,* const gss_OID_set *extension_oids,* const gss_buffer_set_t *extension_buffers,* const gss_buffer_t *input_token,* OM_uint32 *req_flags,* OM_uint32 *time_req,* gss_buffer_t *output_token*)

Initiate the delegation of a credential.

This functions drives the initiating side of the credential delegation process. It is expected to be called in tandem with the gss_accept_delegation function.

Parameters

minor_status	The minor status returned by this function. This paramter will be 0 upon success.
context_handle	The security context over which the credential is delegated.
cred_handle	The credential to be delegated. May be GSS_C_NO_CREDENTIAL in which case the credential associated with the security context is used.
desired_mech	The desired security mechanism. Currently not used. May be GSS_C_NO_OID.
extension_oids	A set of extension oids corresponding to buffers in the extension_buffers parameter below. The extensions specified will be added to the delegated credential. May be GSS_C_NO_BUFFER_SET.
extension_buffers	A set of extension buffers corresponding to oids in the extension_oids paramter above. May be GSS_C_NO_BUFFER_SET.
input_token	The token that was produced by a prior call to gss_accept_delegation. This parameter will be ignored the first time this function is called.
req_flags	Flags that modify the behavior of the function. Currently only GSS_C_GLOBUS_SSL_COMPATIBLE and GSS_C_GLOBUS_LIMITED_DELEG_PROXY_FLAG are checked for. The GSS_C_GLOBUS_SSL_COMPATIBLE flag results in tokens that aren't wrapped and GSS_C_GLOBUS_LIMITED_DELEG_PROXY_FLAG causes the delegated proxy to be limited (requires that no extensions are specified.
time_req	The requested period of validity (seconds) of the delegated credential. Passing a time_req of 0 cause the delegated credential to have the same lifetime as the credential that issued it.
output_token	A token that should be passed to gss_accept_delegation if the return value is GSS_S_CONTINUE_NEEDED.

Returns

GSS_S_COMPLETE upon successful completion GSS_S_CONTINUE_NEEDED if the function needs to be called again. GSS_S_FAILURE upon failure

3.4.3.36 OM_uint32 gss_accept_delegation (OM_uint32 * *minor_status,* const gss_ctx_id_t *context_handle,* const gss_OID_set *extension_oids,* const gss_buffer_set_t *extension_buffers,* const gss_buffer_t *input_token,* OM_uint32 *req_flags,* OM_uint32 *time_req,* OM_uint32 * *time_rec,* gss_cred_id_t * *delegated_cred_handle,* gss_OID * *mech_type,* gss_buffer_t *output_token*)

Accept a delegated credential.

This functions drives the accepting side of the credential delegation process. It is expected to be called in tandem with the gss_init_delegation function.

Parameters

minor_status	The minor status returned by this function. This paramter will be 0 upon success.
context_handle	The security context over which the credential is delegated.
extension_oids	A set of extension oids corresponding to buffers in the extension_buffers paramter below. May be GSS_C_NO_BUFFER_SET. Currently not used.
extension_buffers	A set of extension buffers corresponding to oids in the extension_oids paramter above. May be GSS_C_NO_BUFFER_SET. Currently not used.
input_token	The token that was produced by a prior call to gss_init_delegation.
req_flags	Flags that modify the behavior of the function. Currently only GSS_C_GLOBUS_SSL_COMPATIBLE is checked for. This flag results in tokens that aren't wrapped.
time_req	The requested period of validity (seconds) of the delegated credential. Currently a noop.
time_rec	This parameter will contain the received period of validity of the delegated credential upon success. May be NULL.
delegated_cred_handle	This parameter will contain the delegated credential upon success.
mech_type	Returns the security mechanism upon success. Currently not implemented. May be NULL.
output_token	A token that should be passed to gss_init_delegation if the return value is GSS_S_CONTINUE_NEEDED.

Returns

GSS_S_COMPLETE upon successful completion GSS_S_CONTINUE_NEEDED if the function needs to be called again. GSS_S_FAILURE upon failure

3.4.3.37 OM_uint32 gss_inquire_cred_by_oid (OM_uint32 * *minor_status,* const gss_cred_id_t *cred_handle,* const gss_OID *desired_object,* gss_buffer_set_t * *data_set*)

NOTE: Checks both the cert in the credential and the certs in the cert chain for a valid extension that matches the desired OID.

The first one found is used, starting with the endpoint cert, and then searching the cert chain.

Parameters

minor_status	
cred_handle	
desired_object	
data_set	

Returns

3.4.3.38 OM_uint32 gss_set_sec_context_option (OM_uint32 * *minor_status,* gss_ctx_id_t * *context_handle,* const gss_OID *option,* const gss_buffer_t *value*)

GSSAPI routine to initiate the sending of a security context See: <draft-ietf-cat-gssv2-cbind-04.txt>

Parameters

minor_status	
context_handle	
option	
value	

Returns

3.5 GSS Ret Flags

Collaboration diagram for GSS Ret Flags:

Defines

- #define **GSS_C_GLOBUS_RECEIVED_LIMITED_PROXY_FLAG** 8192
- #define **GSS_C_GLOBUS_RECEIVED_LIMITED_PROXY_DURING_DELEGATION_FLAG** 4096

3.5.1 Detailed Description

These macros set the RETURNED context type - these will be be set (or not) in the context's ret_flags.

3.5.2 Define Documentation

3.5.2.1 #define GSS_C_GLOBUS_RECEIVED_LIMITED_PROXY_FLAG 8192

If the proxy received is a limited proxy, this flag will be set in the returned context flags (ret_flags)

3.5.2.2 #define GSS_C_GLOBUS_RECEIVED_LIMITED_PROXY_DURING_DELEGATION_FLAG 4096

If the proxy received is a limited proxy received during delegation, this flag is set in the returned flags.
