Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3447) will listen on all interfaces.

#### Parameters

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The number of pending connect request the <b>ServerSocket</b> (p. 3447) can queue.
<i>address</i>	The address of the interface on the local machine to bind to.

#### Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

#### Exceptions

<i>IOException</i>	if the <b>ServerSocket</b> (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3459).

**6.592.3.4** `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket ( int port, int backlog )` [virtual]

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will use the specified connection backlog setting.

#### Parameters

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The number of pending connect request the <b>ServerSocket</b> (p. 3447) can queue.

#### Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

#### Exceptions

<i>IOException</i>	if the <b>ServerSocket</b> (p. 3447) cannot be created for some reason.
--------------------	---

Implements **decaf::net::ServerSocketFactory** (p. 3459).

**6.592.3.5** `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getDefaultCipherSuites ( ) [virtual]`

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

#### Returns

an STL vector containing the list of cipher suites enabled by default.

#### See also

`getSupportedCipherSuites()` (p. 3670)

Implements `decaf::net::ssl::SSLServerSocketFactory` (p. 3669).

**6.592.3.6** `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getSupportedCipherSuites ( ) [virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

#### Returns

an STL vector containing the list of supported cipher suites.

#### See also

`getDefaultCipherSuites()` (p. 3669)

Implements `decaf::net::ssl::SSLServerSocketFactory` (p. 3670).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocketFactory.h`

## 6.593 `decaf::internal::net::ssl::openssl::OpenSSLSocket` Class Reference

Wraps a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocket.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocket:

## Public Member Functions

- **OpenSSLSocket** (**OpenSSLParameters** \*parameters)
- **OpenSSLSocket** (**OpenSSLParameters** \*parameters, const **decaf::net::InetAddress** \*address, int port)
- **OpenSSLSocket** (**OpenSSLParameters** \*parameters, const **decaf::net::InetAddress** \*address, int port, const **decaf::net::InetAddress** \*localAddress, int localPort)
- **OpenSSLSocket** (**OpenSSLParameters** \*parameters, const std::string &host, int port)
- **OpenSSLSocket** (**OpenSSLParameters** \*parameters, const std::string &host, int port, const **decaf::net::InetAddress** \*localAddress, int localPort)
- virtual **~OpenSSLSocket** ()
- virtual void **connect** (const std::string &host, int port, int timeout) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException )

*Connects to the specified destination, with a specified timeout value.*

*If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 3650) is thrown. A timeout value of zero is treated as an infinite timeout.*

### Parameters

host	<i>The host name or IP address of the remote host to connect to.</i>
port	<i>The port on the remote host to connect to.</i>
timeout	<i>The number of Milliseconds to wait before treating the connection as failed.</i>

### Exceptions

IOException	<i>Thrown if a failure occurred in the connect.</i>
<b>SocketTimeoutException</b> (p. 3650)	<i>if the timeout for connection is exceeded.</i>
IllegalArgumentEx- ception	<i>if the timeout value is negative or the endpoint is invalid.</i>

- virtual void **close** () throw ( decaf::io::IOException )

*Closes the **Socket** (p. 3607).*

*Once closed a **Socket** (p. 3607) cannot be connected or otherwise operated upon, a new **Socket** (p. 3607) instance must be created.*

### Exceptions

IOException	<i>if an I/O error occurs while closing the <b>Socket</b> (p. 3607).</i>
-------------	--

- virtual **decaf::io::InputStream** \* **getInputStream** () throw ( decaf::io::IOException )

*Gets the **InputStream** for this socket if its connected.*

The pointer returned is the property of the associated **Socket** (p. 3607) and should not be deleted by the caller.

When the returned **InputStream** is performing a blocking operation and the underlying connection is closed or otherwise broken the read calls will normally throw an exception to indicate the failure.

Closing the **InputStream** will also close the underlying **Socket** (p. 3607).

#### Returns

The **InputStream** for this socket.

#### Exceptions

IOException	if an error occurs during creation of the <b>InputStream</b> , also if the <b>Socket</b> (p. 3607) is not connected or the input has been shutdown previously.
-------------	--

- virtual **decaf::io::OutputStream \* getOutputStream ()** throw ( decaf::io::IOException )

Gets the **OutputStream** for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 3607) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 3607) will also close the underlying **Socket** (p. 3607).

#### Returns

the **OutputStream** for this socket.

#### Exceptions

IOException	if an error occurs during the creation of this <b>OutputStream</b> , or if the <b>Socket</b> (p. 3607) is closed or the output has been shutdown previously.
-------------	--

- virtual void **shutdownInput ()** throw ( decaf::io::IOException )

Shuts down the **InputStream** for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

#### Exceptions

IOException	if an I/O error occurs while performing this operation.
-------------	---

- virtual void **shutdownOutput ()** throw ( decaf::io::IOException )

Shuts down the **OutputStream** for this socket, any data already written to the socket will be sent, any further calls to **OutputStream::write** will throw an **IOException**.

#### Exceptions

IOException	if an I/O error occurs while performing this operation.
-------------	---

- virtual void **setOOBInline** (bool value) throw ( decaf::net::SocketException )

Sets the value of the **OOBINLINE** for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the **Socket**'s **InputStream**, no notification is give.

#### Returns

true if **OOBINLINE** is enabled, false otherwise.

*Exceptions*

<b>SocketException</b> (p. 3627)	<i>if an error is encountered while performing this operation.</i>
-------------------------------------	--

- virtual void **sendUrgentData** (int data) throw ( decaf::io::IOException )

*Sends on byte of urgent data to the **Socket** (p. 3607).*

*Parameters*

data	<i>The value to write as urgent data, only the lower eight bits are sent.</i>
------	---

*Exceptions*

IOException	<i>if an I/O error occurs while performing this operation.</i>
-------------	--

- virtual std::vector< std::string > **getSupportedCipherSuites** () const

*Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3670).*

*Normally not all of these cipher suites will be enabled on the **Socket** (p. 3607).*

*Returns*

*a vector containing the names of all the supported cipher suites.*

- virtual std::vector< std::string > **getSupportedProtocols** () const

*Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3670) instance.*

*Returns*

*a vector containing the names of all the supported protocols.*

- virtual std::vector< std::string > **getEnabledCipherSuites** () const

*Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSL Socket** (p. 3607).*

*Returns*

*vector of the names of all enabled Cipher Suites.*

- virtual void **setEnabledCipherSuites** (const std::vector< std::string > &suites)

*Sets the Cipher Suites that are to be enabled on the **SSL Socket** (p. 3607) connection. Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.*

*Parameters*

suites	<i>An Vector of names for all the Cipher Suites that are to be enabled.</i>
--------	---

*Exceptions*

IllegalArgumentExcep- tion	<i>if the vector is empty or one of the names is invalid.</i>
-------------------------------	---

- virtual std::vector< std::string > **getEnabledProtocols** () const

Returns a vector containing the names of all the currently enabled Protocols for this **SSL Socket** (p. 3607).

**Returns**

vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)

Sets the Protocols that are to be enabled on the **SSL Socket** (p. 3607) connection. Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

**Parameters**

protocols	An Vector of names for all the Protocols that are to be enabled.
-----------	--

**Exceptions**

IllegalArgumentExcep- tion	if the vector is empty or one of the names is invalid.
-------------------------------	--

- virtual void **startHandshake** ()

Initiates a handshake for this **SSL Connection**, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an **IOException** to indicate an error.

**Exceptions**

IOException	if an I/O error occurs while performing the Handshake
-------------	---

- virtual void **setUseClientMode** (bool value)

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 3607), once a handshake has be initiated this socket remains the the set mode; client or server; for the life of this object.

**Parameters**

value	The mode setting, true for client or false for server.
-------	--

**Exceptions**

IllegalArguementEx- ception	if the handshake process has begun and mode is locked.
--------------------------------	--

- virtual bool **getUseClientMode** () const

Gets whether this **Socket** (p. 3607) is in Client or Server mode, true indicates that the mode is set to Client.

**Returns**

true if the **Socket** (p. 3607) is in Client mode, false otherwise.

- virtual void **setNeedClientAuth** (bool value)

*Sets the **Socket** (p. 3607) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

*This option only applies to sockets in the Server mode.*

*If the option is enabled and the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.*

**Parameters**

value	The value indicating if a client is required to authenticate itself or not.
-------	---

- virtual bool **getNeedClientAuth** () const

*Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.*

*This option is only useful when the socket is operating in server mode.*

**Returns**

*true if client authentication is required.*

- virtual void **setWantClientAuth** (bool value)

*Sets the **Socket** (p. 3607) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

*This option only applies to sockets in the Server mode.*

*If the option is enabled and the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.*

**Parameters**

value	The value indicating if a client is requested to authenticate itself or not.
-------	--

- virtual bool **getWantClientAuth** () const

*Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.*

*This option is only useful when the socket is operating in server mode.*

**Returns**

*true if client authentication is required.*

- int **read** (unsigned char \*buffer, int size, int offset, int length)

*Reads the requested data from the Socket and write it into the passed in buffer.*

- void **write** (const unsigned char \*buffer, int size, int offset, int length)

*Writes the specified data in the passed in buffer to the Socket.*

- int **available** ()

*Gets the number of bytes in the Socket buffer that can be read without blocking.*

### 6.593.1 Detailed Description

Wraps a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

**Since**

1.0

### 6.593.2 Constructor & Destructor Documentation

**6.593.2.1** decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (   
 OpenSSLParameters \* *parameters* )

**6.593.2.2** decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (   
 OpenSSLParameters \* *parameters*, const decaf::net::InetAddress \* *address*, int *port* )

**6.593.2.3** decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (

**6.593.2.6** virtual decaf::internal::net::ssl::openssl::OpenSSLSocket::~~OpenSSLSocket ( )   
 [virtual]

### 6.593.3 Member Function Documentation

**6.593.3.1** int decaf::internal::net::ssl::openssl::OpenSSLSocket::available ( )

Gets the number of bytes in the Socket buffer that can be read without blocking.

**Returns**

the number of bytes that can be read from the Socket without blocking.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

**6.593.3.2** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::close ( ) throw ( decaf::io::IOException )` [virtual]

Closes the **Socket** (p. 3607).

Once closed a **Socket** (p. 3607) cannot be connected or otherwise operated upon, a new **Socket** (p. 3607) instance must be created.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while closing the <b>Socket</b> (p. 3607).
--------------------	---

Reimplemented from **decaf::net::Socket** (p. 3614).

**6.593.3.3** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::connect ( const std::string & host, int port, int timeout ) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException )` [virtual]

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 3650) is thrown. A timeout value of zero is treated as an infinite timeout.

#### Parameters

<i>host</i>	The host name or IP address of the remote host to connect to.
<i>port</i>	The port on the remote host to connect to.
<i>timeout</i>	The number of Milliseconds to wait before treating the connection as failed.

#### Exceptions

<i>IOException</i>	Thrown if a failure occurred in the connect.
<i>SocketTimeoutException</i> (p. 3650)	if the timeout for connection is exceeded.
<i>IllegalArgumentEx-ception</i>	if the timeout value is negative or the endpoint is invalid.

Reimplemented from **decaf::net::Socket** (p. 3615).

**6.593.3.4** `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledCipherSuites ( ) const` [virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 3607).

#### Returns

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLSocket** (p. 3674).

**6.593.3.5** `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledProtocols ( ) const [virtual]`

Returns a vector containing the names of all the currently enabled Protocols for this **SSL Socket** (p. 3607).

#### Returns

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 3674).

**6.593.3.6** `virtual decaf::io::InputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getInputStream ( ) throw ( decaf::io::IOException ) [virtual]`

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 3607) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broken the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 3607).

#### Returns

The InputStream for this socket.

#### Exceptions

<i>IOException</i>	if an error occurs during creation of the InputStream, also if the <b>Socket</b> (p. 3607) is not connected or the input has been shutdown previously.
--------------------	--

Reimplemented from **decaf::net::Socket** (p. 3616).

**6.593.3.7** `virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getNeedClientAuth ( ) const [virtual]`

Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

**Returns**

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 3675).

**6.593.3.8** `virtual decaf::io::OutputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getOutputStream ( ) throw ( decaf::io::IOException ) [virtual]`

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 3607) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 3607) will also close the underlying **Socket** (p. 3607).

**Returns**

the OutputStream for this socket.

**Exceptions**

<i>IOException</i>	if an error occurs during the creation of this OutputStream, or if the <b>Socket</b> (p. 3607) is closed or the output has been shutdown previously.
--------------------	--

Reimplemented from **decaf::net::Socket** (p. 3617).

**6.593.3.9** `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedCipherSuites ( ) const [virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3670).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3607).

**Returns**

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLSocket** (p. 3675).

**6.593.3.10** `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedProtocols ( ) const [virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3670) instance.

**Returns**

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 3675).

**6.593.3.11** `virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getUseClientMode ( ) const` [virtual]

Gets whether this **Socket** (p. 3607) is in Client or Server mode, true indicates that the mode is set to Client.

**Returns**

true if the **Socket** (p. 3607) is in Client mode, false otherwise.

Implements **decaf::net::ssl::SSLSocket** (p. 3676).

**6.593.3.12** `virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getWantClientAuth ( ) const` [virtual]

Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

**Returns**

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 3676).

**6.593.3.13** `int decaf::internal::net::ssl::openssl::OpenSSLSocket::read ( unsigned char * buffer, int size, int offset, int length )`

Reads the requested data from the Socket and write it into the passed in buffer.

**Parameters**

<i>buffer</i>	The buffer to read into
<i>size</i>	The size of the specified buffer
<i>offset</i>	The offset into the buffer where reading should start filling.
<i>length</i>	The number of bytes past offset to fill with data.

**Returns**

the actual number of bytes read or -1 if at EOF.

**Exceptions**

<i>IOException</i>	if an I/O error occurs during the read.
<i>NullPointerException</i>	if buffer is Null.
<i>IndexOutOfBoundsException</i>	if offset + length is greater than buffer size.

**6.593.3.14** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::sendUrgentData ( int data ) throw ( decaf::io::IOException ) [virtual]`

Sends on byte of urgent data to the **Socket** (p. 3607).

**Parameters**

<i>data</i>	The value to write as urgent data, only the lower eight bits are sent.
-------------	--

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented from **decaf::net::Socket** (p. 3621).

**6.593.3.15** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledCipherSuites ( const std::vector< std::string > & suites ) [virtual]`

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 3607) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

**Parameters**

<i>suites</i>	An Vector of names for all the Cipher Suites that are to be enabled.
---------------	--

**Exceptions**

<i>IllegalArgumentEx-ception</i>	if the vector is empty or one of the names is invalid.
----------------------------------	--

Implements **decaf::net::ssl::SSLSocket** (p. 3676).

**6.593.3.16** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledProtocols ( const std::vector< std::string > & protocols ) [virtual]`

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 3607) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

## 6.593 decaf::internal::net::ssl::openssl::OpenSSLSocket Class Reference 2955

### Parameters

<i>protocols</i>	An Vector of names for all the Protocols that are to be enabled.
------------------	--

### Exceptions

<i>IllegalArgumentException</i>	if the vector is empty or one of the names is invalid.
---------------------------------	--

Implements **decaf::net::ssl::SSLSocket** (p. 3677).

**6.593.3.17** virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setNeedClientAuth ( bool *value* ) [virtual]

Sets the **Socket** (p. 3607) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

### Parameters

<i>value</i>	The value indicating if a client is required to authenticate itself or not.
--------------	---

Implements **decaf::net::ssl::SSLSocket** (p. 3677).

**6.593.3.18** virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setOOBInline ( bool *value* ) throw ( decaf::net::SocketException ) [virtual]

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

### Returns

true if OOBINLINE is enabled, false otherwise.

### Exceptions

<i>SocketException</i> (p. 3627)	if an error is encountered while performing this operation.
-------------------------------------	---

Reimplemented from **decaf::net::Socket** (p. 3621).

**6.593.3.19** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setUseClientMode ( bool value ) [virtual]`

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 3607), once a handshake has been initiated this socket remains in the set mode; client or server, for the life of this object.

#### Parameters

<i>value</i>	The mode setting, true for client or false for server.
--------------	--

#### Exceptions

<i>IllegalArgumentException</i>	if the handshake process has begun and mode is locked.
---------------------------------	--

Implements **decaf::net::ssl::SSLSocket** (p. 3678).

**6.593.3.20** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setWantClientAuth ( bool value ) [virtual]`

Sets the **Socket** (p. 3607) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled and the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the `setNeedClientAuth` method.

#### Parameters

<i>value</i>	The value indicating if a client is requested to authenticate itself or not.
--------------	--

Implements **decaf::net::ssl::SSLSocket** (p. 3678).

**6.593.3.21** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownInput ( ) throw ( decaf::io::IOException ) [virtual]`

Shuts down the `InputStream` for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented from **decaf::net::Socket** (p. 3625).

**6.593.3.22** virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownOutput ( )  
throw ( decaf::io::IOException ) [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented from **decaf::net::Socket** (p. 3625).

**6.593.3.23** virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::startHandshake ( )  
[virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing the Handshake
--------------------	---

Implements **decaf::net::ssl::SSLSocket** (p. 3679).

**6.593.3.24** void decaf::internal::net::ssl::openssl::OpenSSLSocket::write ( const unsigned char  
\* *buffer*, int *size*, int *offset*, int *length* )

Writes the specified data in the passed in buffer to the Socket.

#### Parameters

<i>buffer</i>	The buffer to write to the socket.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset into the buffer where the data to write starts at.
<i>length</i>	The number of bytes past offset to write.

#### Exceptions

<i>IOException</i>	if an I/O error occurs during the write.
<i>NullPointerException</i>	if buffer is Null.
<i>IndexOutOfBoundsException</i>	if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

## 6.594 decaf::internal::net::ssl::openssl::OpenSSLSocketException

### Class Reference

Subclass of the standard `SocketException` that knows how to produce an error message from the OpenSSL error stack.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketException.h>
```

Inheritance diagram for `decaf::internal::net::ssl::openssl::OpenSSLSocketException`:

### Public Member Functions

- **OpenSSLSocketException** () throw ()  
*Creates a new **OpenSSLSocketException** (p. 2955) with default values.*
- **OpenSSLSocketException** (const Exception &ex) throw ()  
*Conversion Constructor from some other Exception.*
- **OpenSSLSocketException** (const **OpenSSLSocketException** &ex) throw ()  
*Copy Constructor.*
- **OpenSSLSocketException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Create a new **OpenSSLSocketException** (p. 2955) and initializes the file name and line number where this message occurred.*
- **OpenSSLSocketException** (const std::exception \*cause) throw ()  
*Creates a new **OpenSSLSocketException** (p. 2955) with the passed exception set as the cause of this exception.*
- **OpenSSLSocketException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Create a new **OpenSSLSocketException** (p. 2955) and initializes the file name and line number where this message occurred.*
- **OpenSSLSocketException** (const char \*file, const int lineNumber) throw ()  
*Create a new **OpenSSLSocketException** (p. 2955) and initializes the file name and line number where this message occurred.*
- virtual **OpenSSLSocketException** \* clone () const  
*Clones this exception.*
- virtual ~**OpenSSLSocketException** () throw ()

## Protected Member Functions

- std::string **getErrorString** () const

*Gets and formats an error message string from the OpenSSL error stack.*

### 6.594.1 Detailed Description

Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

Since

1.0

### 6.594.2 Constructor & Destructor Documentation

6.594.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException  
( ) throw ()

Creates an new **OpenSSLSocketException** (p. 2955) with default values.

6.594.2.2 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException  
( const Exception & ex ) throw ()

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An Exception object that should become this type of Exception.
-----------	--

6.594.2.3 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException  
( const OpenSSLSocketException & ex ) throw ()

Copy Constructor.

#### Parameters

<i>ex</i>	The <b>OpenSSLSocketException</b> (p. 2955) whose values should be copied to this instance.
-----------	---

**6.594.2.4** `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException ( const char * file, const int lineNumber, const std::exception * cause, const char * msg, ... ) throw ()`

Create a new **OpenSSLSocketException** (p. 2955) and initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown (can be null).
<i>msg</i>	The error message to report.
...	The list of primitives that are formatted into the message.

**6.594.2.5** `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException ( const std::exception * cause ) throw ()`

Creates a new **OpenSSLSocketException** (p. 2955) with the passed exception set as the cause of this exception.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.594.2.6** `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException ( const char * file, const int lineNumber, const char * msg, ... ) throw ()`

Create a new **OpenSSLSocketException** (p. 2955) and initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

#### Parameters

<i>file</i>	The file name where exception occurs.
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The error message to report.
...	The list of primitives that are formatted into the message

**6.594.2.7** decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException  
( const char \* *file*, const int *lineNumber* ) throw ()

Create a new **OpenSSLSocketException** (p. 2955) and initializes the file name and line number where this message occurred.

Sets the message to report by getting the complete set of error messages from the OpenSSL error stack and concatenating them into one string.

#### Parameters

<i>file</i>	The file name where exception occurs.
<i>lineNumber</i>	The line number where the exception occurred.

**6.594.2.8** virtual decaf::internal::net::ssl::openssl::OpenSSLSocketException::~OpenSSLSocketException  
( ) throw () [virtual]

#### 6.594.3 Member Function Documentation

**6.594.3.1** virtual OpenSSLSocketException\* decaf::internal::net::ssl::openssl::OpenSSLSocketException::clone (  
) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override this method.

#### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 3629).

**6.594.3.2** std::string decaf::internal::net::ssl::openssl::OpenSSLSocketException::getErrorString  
( ) const [protected]

Gets and formats an error message string from the OpenSSL error stack.

#### Returns

a string containing the complete OpenSSL error string.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketException.h**

## 6.595 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketFactory.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketFactory:

### Public Member Functions

- **OpenSSLSocketFactory** (**OpenSSLContextSpi** \*parent)
- virtual **~OpenSSLSocketFactory** ()
- virtual **decaf::net::Socket** \* **createSocket** () throw ( decaf::io::IOException )

*Creates an unconnected **Socket** (p. 3607) object.*

#### Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

#### Exceptions

IOException	<i>if the <b>Socket</b> (p. 3607) cannot be created.</i>
-------------	--

- virtual **decaf::net::Socket** \* **createSocket** (const **decaf::net::InetAddress** \*host, int port) throw ( decaf::io::IOException, decaf::net::UnknownHostException )

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

#### Parameters

host	<i>The host to connect the socket to.</i>
port	<i>The port on the remote host to connect to.</i>

#### Returns

*a new **Socket** (p. 3607) object, caller must free this object when done.*

#### Exceptions

IOException	<i>if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.</i>
<b>UnknownHostException</b> (p. 4019)	<i>if the host name is not known.</i>

- virtual **decaf::net::Socket** \* **createSocket** (const **decaf::net::InetAddress** \*host, int port, const **decaf::net::InetAddress** \*ifAddress, int localPort) throw ( decaf::io::IOException, decaf::net::UnknownHostException )

*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

*The **Socket** (p. 3607) will be bound to the specified local address and port.*

## 6.595 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

### Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the <b>Socket</b> (p. 3607) to.
localPort	The local port to bind the <b>Socket</b> (p. 3607) to.

### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

### Exceptions

IOException	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

- virtual **decaf::net::Socket** \* **createSocket** (const std::string &hostname, int port) throw ( decaf::io::IOException, decaf::net::UnknownHostException )

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

### Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.

### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

### Exceptions

IOException	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

- virtual **decaf::net::Socket** \* **createSocket** (const std::string &name, int port, const **decaf::net::InetAddress** \*ifAddress, int localPort) throw ( decaf::io::IOException, decaf::net::UnknownHostException )

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

### Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the <b>Socket</b> (p. 3607) to.
localPort	The local port to bind the <b>Socket</b> (p. 3607) to.

### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

### Exceptions

IOException	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
-------------	---

<b>UnknownHostException</b> (p. 4019)	if the host name is not known.
--	--------------------------------

- virtual `std::vector< std::string > getDefaultCipherSuites ()`

Returns the list of cipher suites which are enabled by default.  
Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

**Returns**

an STL vector containing the list of cipher suites enabled by default.

**See also**

`getSupportedCipherSuites()` (p. 3682)

- virtual `std::vector< std::string > getSupportedCipherSuites ()`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

**Returns**

an STL vector containing the list of supported cipher suites.

**See also**

`getDefaultCipherSuites()` (p. 3681)

- virtual `decaf::net::Socket * createSocket (decaf::net::Socket *socket, std::string host, int port, bool autoClose)`

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

**Parameters**

socket	The existing socket to layer over.
host	The server host the original <b>Socket</b> (p. 3607) is connected to.
port	The server port the original <b>Socket</b> (p. 3607) is connected to.
autoClose	Should the layered over <b>Socket</b> (p. 3607) be closed when the topmost socket is closed.

**Returns**

a new **Socket** (p. 3607) instance that wraps the given **Socket** (p. 3607).

**Exceptions**

IOException	if an I/O exception occurs while performing this operation.
-------------	---

## 6.595 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

<b>UnknownHostException</b> (p. 4019)	<i>if the host is unknown.</i>
--	--------------------------------

### 6.595.1 Detailed Description

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

#### Since

1.0

### 6.595.2 Constructor & Destructor Documentation

6.595.2.1 **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::OpenSSLSocketFactory ( OpenSSLContextSpi \* *parent* )**

6.595.2.2 **virtual decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::~~OpenSSLSocketFactory ( ) [virtual]**

### 6.595.3 Member Function Documentation

6.595.3.1 **virtual decaf::net::Socket\* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket ( ) throw ( decaf::io::IOException ) [virtual]**

Creates an unconnected **Socket** (p. 3607) object.

#### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

#### Exceptions

<i>IOException</i>	if the <b>Socket</b> (p. 3607) cannot be created.
--------------------	---

Reimplemented from **decaf::net::SocketFactory** (p. 3631).

6.595.3.2 **virtual decaf::net::Socket\* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket ( decaf::net::Socket \* *socket*, std::string *host*, int *port*, bool *autoClose* ) [virtual]**

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer

destination. This socket is configured using the socket options established for this factory.

#### Parameters

<i>socket</i>	The existing socket to layer over.
<i>host</i>	The server host the original <b>Socket</b> (p. 3607) is connected to.
<i>port</i>	The server port the original <b>Socket</b> (p. 3607) is connected to.
<i>autoClose</i>	Should the layered over <b>Socket</b> (p. 3607) be closed when the topmost socket is closed.

#### Returns

a new **Socket** (p. 3607) instance that wraps the given **Socket** (p. 3607).

#### Exceptions

<i>IOException</i>	if an I/O exception occurs while performing this operation.
<b>UnknownHostException</b> (p. 4019)	if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3680).

**6.595.3.3** `virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket  
( const decaf::net::InetAddress * host, int port ) throw ( de-  
caf::io::IOException, decaf::net::UnknownHostException )  
[virtual]`

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

#### Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

#### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3631).

## 6.595 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

**6.595.3.4** virtual decaf::net::Socket\* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket ( const std::string & *hostname*, int *port* ) throw ( decaf::io::IOException, decaf::net::UnknownHostException ) [virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

### Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

### Exceptions

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3632).

**6.595.3.5** virtual decaf::net::Socket\* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket ( const std::string & *name*, int *port*, const decaf::net::InetAddress \* *ifAddress*, int *localPort* ) throw ( decaf::io::IOException, decaf::net::UnknownHostException ) [virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

### Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the <b>Socket</b> (p. 3607) to.
<i>localPort</i>	The local port to bind the <b>Socket</b> (p. 3607) to.

### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

### Exceptions

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3632).

```
6.595.3.6 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket
( const decaf::net::InetAddress * host, int port, const de-
caf::net::InetAddress * ifAddress, int localPort ) throw (
decaf::io::IOException, decaf::net::UnknownHostException )
[virtual]
```

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

The **Socket** (p. 3607) will be bound to the specified local address and port.

#### Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the <b>Socket</b> (p. 3607) to.
<i>localPort</i>	The local port to bind the <b>Socket</b> (p. 3607) to.

#### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<i>UnknownHostException</i> (p. 4019)	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3633).

```
6.595.3.7 virtual std::vector<std::string> de-
caf::internal::net::ssl::openssl::OpenSSLSocketFactory::getDefaultCipherSuites ( )
[virtual]
```

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

#### Returns

an STL vector containing the list of cipher suites enabled by default.

#### See also

**getSupportedCipherSuites()** (p. 3682)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3681).

6.595.3.8 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getSupportedCipherSuites ( ) [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

### Returns

an STL vector containing the list of supported cipher suites.

### See also

**getDefaultCipherSuites()** (p. 3681)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3682).

The documentation for this class was generated from the following file:

## 6.596 decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream Class Reference

An output stream for reading data from an OpenSSL Socket instance.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketInputStream.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream:

### Public Member Functions

- **OpenSSLSocketInputStream (OpenSSLSocket \*socket)**
- virtual **~OpenSSLSocketInputStream ()**
- virtual int **available ()** const throw ( decaf::io::IOException )

*Indicates the number of bytes available.*

*The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.*

*The default implementation of this method returns zero.*

#### Returns

*the number of bytes available on this input stream.*

*Exceptions*

<b>IOException</b> (p. 2210)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual void **close** () throw ( decaf::io::IOException )

*Close - does nothing.*

- virtual long long **skip** (long long num) throw ( decaf::io::IOException, decaf::lang::exceptions::Unsupported )

*Not supported.*

**Protected Member Functions**

- virtual int **doReadByte** () throw ( io::IOException )
- virtual int **doReadArrayBounded** (unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

**6.596.1 Detailed Description**

An output stream for reading data from an OpenSSL Socket instance.

Since

1.0

**6.596.2 Constructor & Destructor Documentation**

**6.596.2.1** decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::OpenSSLSocketInputStream ( OpenSSLSocket \* *socket* )

**6.596.2.2** virtual decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::~~OpenSSLSocketInputStream ( ) [virtual]

**6.596.3 Member Function Documentation**

**6.596.3.1** virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::available ( ) const throw ( decaf::io::IOException ) [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

## Returns

the number of bytes available on this input stream.

## Exceptions

<i><b>IOException</b></i> (p. 2210)	if an I/O error occurs.
--	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 2107).

**6.596.3.2** `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::close ( )  
throw ( decaf::io::IOException ) [virtual]`

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 2105) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::InputStream** (p. 2108).

**6.596.3.3** `virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadArrayBounded  
( unsigned char * buffer, int size, int offset, int  
length ) throw ( decaf::io::IOException, de-  
caf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::NullPointerException ) [protected,  
virtual]`

Reimplemented from **decaf::io::InputStream** (p. 2108).

**6.596.3.4** `virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadByte  
( ) throw ( io::IOException ) [protected, virtual]`

Implements **decaf::io::InputStream** (p. 2109).

**6.596.3.5** `virtual long long decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::skip  
( long long num ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Not supported.

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions;

reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

#### Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

#### Returns

total bytes skipped

#### Exceptions

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
<b><i>UnsupportedOperationException</i></b>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 2113).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketInputStream.h

## 6.597 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream Class Reference

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 2940) instance.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketOutputStream>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream:

#### Public Member Functions

- **OpenSSLSocketOutputStream** (**OpenSSLSocket** \*socket)
- virtual **~OpenSSLSocketOutputStream** ()
- virtual void **close** () throw ( decaf::io::IOException )

*Closes this object and deallocates the appropriate resources.  
The object is generally no longer usable after calling close.*

#### Exceptions

<b>IOException</b> (p. 2210)	if an error occurs while closing.
------------------------------	-----------------------------------

*The default implementation of this method does nothing.*

## Protected Member Functions

- virtual void **doWriteByte** (unsigned char c) throw ( decaf::io::IOException )
- virtual void **doWriteArrayBounded** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

### 6.597.1 Detailed Description

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 2940) instance.

Since

1.0

### 6.597.2 Constructor & Destructor Documentation

6.597.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::OpenSSLSocketOutputStream ( **OpenSSLSocket** \* *socket* )

6.597.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::~~OpenSSLSocketOutputStream ( ) [virtual]

### 6.597.3 Member Function Documentation

6.597.3.1 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::close ( ) throw ( **decaf::io::IOException** ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

## Exceptions

<b>IOException</b> (p. 2210)	if an error occurs while closing.
---------------------------------	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2993).

6.597.3.2 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteArrayBounded ( const unsigned char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )` [protected, virtual]

Reimplemented from `decaf::io::OutputStream` (p. 2994).

6.597.3.3 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteByte ( unsigned char c ) throw ( decaf::io::IOException )` [protected, virtual]

Implements `decaf::io::OutputStream` (p. 2994).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketOutputStream.h`

## 6.598 activemq::wireformat::openwire::OpenWireFormat Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h>
```

Inheritance diagram for `activemq::wireformat::openwire::OpenWireFormat`:

### Public Member Functions

- **OpenWireFormat** (const `decaf::util::Properties` &properties)  
*Constructs a new **OpenWireFormat** (p. 2971) object.*
- virtual `~OpenWireFormat` ()
- virtual bool **hasNegotiator** () const  
*Returns true if this **WireFormat** (p. 4088) has a Negotiator that needs to wrap the Transport that uses it.*
- virtual `Pointer< transport::Transport > createNegotiator` (const `Pointer< transport::Transport > &transport`) throw ( `decaf::lang::exceptions::UnsupportedOperationException` )  
*If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.*

*Checks if the tcpNoDelayEnabled flag is on.*
- **void setTcpNoDelayEnabled (bool tcpNoDelayEnabled)**  
*Sets if the tcpNoDelayEnabled flag is on.*
- **int getVersion () const**  
*Get the current Wireformat Version.*
- **void setVersion (int version) throw ( decaf::lang::exceptions::IllegalArgumentException )**  
*Set the current Wireformat Version.*
- **virtual bool inReceive () const**  
*Is there a Message being unmarshaled?*
- **bool isCacheEnabled () const**  
*Checks if the cacheEnabled flag is on.*
- **void setCacheEnabled (bool cacheEnabled)**  
*Sets if the cacheEnabled flag is on.*
- **int getCacheSize () const**  
*Returns the currently set Cache size.*
- **void setCacheSize (int value)**  
*Sets the current Cache size.*
- **bool isTightEncodingEnabled () const**  
*Checks if the tightEncodingEnabled flag is on.*
- **void setTightEncodingEnabled (bool tightEncodingEnabled)**  
*Sets if the tightEncodingEnabled flag is on.*
- **bool isSizePrefixDisabled () const**  
*Checks if the sizePrefixDisabled flag is on.*
- **void setSizePrefixDisabled (bool sizePrefixDisabled)**  
*Sets if the sizePrefixDisabled flag is on.*

## 6.598 activemq::wireformat::openwire::OpenWireFormat Class Reference 2977

- long long **getMaxInactivityDuration** () const  
*Gets the MaxInactivityDuration setting.*
- void **setMaxInactivityDuration** (long long value)  
*Sets the MaxInactivityDuration setting.*
- long long **getMaxInactivityDurationInitialDelay** () const  
*Gets the MaxInactivityDurationInitialDelay setting.*
- void **setMaxInactivityDurationInitialDelay** (long long value)  
*Sets the MaxInactivityDurationInitialDelay setting.*

### Protected Member Functions

- **commands::DataStructure \* doUnmarshal** (decaf::io::DataInputStream \*dis)  
throw ( decaf::io::IOException )  
*Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.*
- void **destroyMarshallers** ()  
*Cleans up all registered Marshallers and empties the dataMarshallers vector.*

### Static Protected Attributes

- static const unsigned char **NULL\_TYPE**
- static const int **DEFAULT\_VERSION** = 1

### 6.598.1 Constructor & Destructor Documentation

- 6.598.1.1 **activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat** ( const decaf::util::Properties & *properties* )

Constructs a new **OpenWireFormat** (p. 2971) object.

#### Parameters

<i>properties</i>	- can contain optional config params.
-------------------	---------------------------------------

6.598.1.2 `virtual activemq::wireformat::openwire::OpenWireFormat::~~OpenWireFormat ( )`  
[virtual]

## 6.598.2 Member Function Documentation

6.598.2.1 `void activemq::wireformat::openwire::OpenWireFormat::addMarshaller (`  
`marshal::DataStreamMarshaller * marshaller )`

Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.

### Parameters

<i>marshaller</i>	- the Marshaler to add to the collection.
-------------------	---

6.598.2.2 `virtual Pointer<transport::Transport>`  
`activemq::wireformat::openwire::OpenWireFormat::createNegotiator (`  
`const Pointer< transport::Transport > & transport ) throw (`  
`decaf::lang::exceptions::UnsupportedOperationException )`  
[virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

### Returns

new instance of a **WireFormatNegotiator** (p. 4129).

Implements **activemq::wireformat::WireFormat** (p. 4089).

6.598.2.3 `void activemq::wireformat::openwire::OpenWireFormat::destroyMarshalers ( )`  
[protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector.

This should be called before a reconfiguration of the version marshalers, or on destruction of this object

6.598.2.4 `commands::DataStructure* ac-`  
`tivemq::wireformat::openwire::OpenWireFormat::doUnmarshal (`  
`decaf::io::DataInputStream * dis ) throw ( decaf::io::IOException )`  
[protected]

Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.

This method can return null if the type of the object to unmarshal is NULL, empty data.

## 6.598 activemq::wireformat::openwire::OpenWireFormat Class Reference 2979

### Parameters

<i>dis</i>	- DataInputStream to read from
------------	--------------------------------

### Returns

new DataStructure\* that the caller owns

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal
--------------------	---

**6.598.2.5** `int activemq::wireformat::openwire::OpenWireFormat::getCacheSize ( ) const`  
[inline]

Returns the currently set Cache size.

### Returns

the current value of the broker's cache size.

**6.598.2.6** `long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration`  
`( ) const` [inline]

Gets the MaxInactivityDuration setting.

### Returns

maximum inactivity duration value in milliseconds.

**6.598.2.7** `long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay`  
`( ) const` [inline]

Gets the MaxInactivityDurationInitialDelay setting.

### Returns

maximum inactivity duration initial delay value in milliseconds.

**6.598.2.8** `virtual const Pointer<commands::WireFormatInfo>&`  
`activemq::wireformat::openwire::OpenWireFormat::getPreferredWireFormatInfo ( )`  
`const` [inline, virtual]

Gets the Preferred WireFormatInfo object that this class holds.

### Returns

pointer to a preferred WireFormatInfo object

**6.598.2.9** `int activemq::wireformat::openwire::OpenWireFormat::getVersion ( ) const`  
`[inline, virtual]`

Get the current Wireformat Version.

#### Returns

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 4090).

**6.598.2.10** `virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator ( )`  
`const [inline, virtual]`

Returns true if this **WireFormat** (p.4088) has a Negotiator that needs to wrap the Transport that uses it.

#### Returns

true if the **WireFormat** (p. 4088) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 4090).

**6.598.2.11** `virtual bool activemq::wireformat::openwire::OpenWireFormat::inReceive ( ) const`  
`[inline, virtual]`

Is there a Message being unmarshaled?

#### Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 4090).

**6.598.2.12** `bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled ( ) const`  
`[inline]`

Checks if the cacheEnabled flag is on.

#### Returns

true if the flag is on.

**6.598.2.13** `bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled ( )`  
`const [inline]`

Checks if the sizePrefixDisabled flag is on.

## 6.598 activemq::wireformat::openwire::OpenWireFormat Class Reference 2981

### Returns

true if the flag is on.

**6.598.2.14** `bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled ( )`  
`const [inline]`

Checks if the stackTraceEnabled flag is on.

### Returns

true if the flag is on.

**6.598.2.15** `bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled ( )`  
`const [inline]`

Checks if the tcpNoDelayEnabled flag is on.

### Returns

true if the flag is on.

**6.598.2.16** `bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled ( )`  
`const [inline]`

Checks if the tightEncodingEnabled flag is on.

### Returns

true if the flag is on.

**6.598.2.17** `void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject (`  
`commands::DataStructure * o, decaf::io::DataOutputStream * dataOut`  
`) throw ( decaf::io::IOException )`

Utility method to loosely Marshal an object that is derived from the DataStructure interface.

The marshaled data is written to the passed in DataOutputStream.

### Parameters

<i>o</i>	- DataStructure derived Object to Marshal
<i>dataOut</i>	- DataOutputStream to write the data to

**Exceptions**

<i>IOException</i>	if an error occurs.
--------------------	---------------------

**6.598.2.18** **commands::DataStructure\*** **activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject (**  
**decaf::io::DataInputStream \* *dis* ) throw ( decaf::io::IOException )**

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

Will read the Data and construct a new DataStructure based Object, the pointer to the Object returned is now owned by the caller.

**Parameters**

<i>dis</i>	- the DataInputStream to read the data from
------------	---

**Returns**

a new DataStructure derived Object pointer

**Exceptions**

<i>IOException</i>	if an error occurs.
--------------------	---------------------

**6.598.2.19** **virtual void** **activemq::wireformat::openwire::OpenWireFormat::marshal**  
**( const Pointer< commands::Command > & *command*,**  
**const activemq::transport::Transport \* *transport*,**  
**decaf::io::DataOutputStream \* *out* ) throw ( decaf::io::IOException )**  
 [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

**Parameters**

<i>command</i>	The Command to Marshal.
<i>transport</i>	The Transport instance that called this method.
<i>out</i>	The output stream to write the command to.

**Exceptions**

<i>IOException</i>
--------------------

Implements **activemq::wireformat::WireFormat** (p. 4091).

## **6.598 activemq::wireformat::openwire::OpenWireFormat Class Reference 2983**

**6.598.2.20** void activemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat  
( const commands::WireFormatInfo & *info* ) throw (  
decaf::lang::exceptions::IllegalStateException )

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

### **Parameters**

<i>info</i>	- The new Wireformat Info settings
-------------	------------------------------------

### **Exceptions**

<i>IllegalStateException</i>	is wire format can't be negotiated.
------------------------------	-------------------------------------

**6.598.2.21** void activemq::wireformat::openwire::OpenWireFormat::setCacheEnabled ( bool  
*cacheEnabled* ) [inline]

Sets if the cacheEnabled flag is on.

### **Parameters**

<i>cacheEnabled</i>	- true to turn flag is on
---------------------	---------------------------

**6.598.2.22** void activemq::wireformat::openwire::OpenWireFormat::setCacheSize ( int *value* )  
[inline]

Sets the current Cache size.

### **Parameters**

<i>value</i>	- the value to send as the broker's cache size.
--------------	---

**6.598.2.23** void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration ( long long *value* ) [inline]

Sets the MaxInactivityDuration setting.

### **Parameters**

<i>value</i>	- the Max inactivity duration value in milliseconds.
--------------	--

**6.598.2.24** `void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay ( long long value ) [inline]`

Sets the MaxInactivityDurationInitialDelay setting.

#### Parameters

<i>value</i>	- the Max inactivity Initial Delay duration value in milliseconds.
--------------	--

**6.598.2.25** `virtual void activemq::wireformat::openwire::OpenWireFormat::setPreferedWireFormatInfo ( const Pointer< commands::WireFormatInfo > & info ) throw ( decaf::lang::exceptions::IllegalStateException ) [virtual]`

Configures this object using the provided WireformatInfo object.

#### Parameters

<i>info</i>	- a WireFormatInfo object, takes ownership.
-------------	---

**6.598.2.26** `void activemq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled ( bool sizePrefixDisabled ) [inline]`

Sets if the sizePrefixDisabled flag is on.

#### Parameters

<i>sizePrefixDisabled</i>	- true to turn flag is on
---------------------------	---------------------------

**6.598.2.27** `void activemq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled ( bool stackTraceEnabled ) [inline]`

Sets if the stackTraceEnabled flag is on.

#### Parameters

<i>stack-TraceEnabled</i>	- true to turn flag is on
---------------------------	---------------------------

**6.598.2.28** `void activemq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled ( bool tcpNoDelayEnabled ) [inline]`

Sets if the tcpNoDelayEnabled flag is on.

## 6.598 activemq::wireformat::openwire::OpenWireFormat Class Reference 2985

### Parameters

<i>tcpNoDelayEnabled</i>	- true to turn flag is on
--------------------------	---------------------------

**6.598.2.29** void activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled ( bool *tightEncodingEnabled* ) [inline]

Sets if the tightEncodingEnabled flag is on.

### Parameters

<i>tightEncodingEnabled</i>	- true to turn flag is on
-----------------------------	---------------------------

**6.598.2.30** void activemq::wireformat::openwire::OpenWireFormat::setVersion ( int *version* ) throw ( decaf::lang::exceptions::IllegalArgumentException ) [virtual]

Set the current Wireformat Version.

### Parameters

<i>version</i>	- int that identifies the version
----------------	-----------------------------------

Implements **activemq::wireformat::WireFormat** (p. 4091).

**6.598.2.31** virtual int activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1 ( commands::DataStructure \* *object*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Utility method for Tight Marshaling the given object to the boolean stream passed.

### Parameters

<i>object</i>	- The DataStructure to marshal
<i>bs</i>	- the BooleanStream to write to

### Returns

size of the data returned.

**6.598.2.32** `void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 ( commands::DataStructure * o, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`

Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.

Writes the data to the Data Output Stream provided.

#### Parameters

<i>o</i>	- DataStructure object
<i>ds</i>	- DataOuputStream for writing
<i>bs</i>	- BooleanStream

#### Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

**6.598.2.33** `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject ( decaf::io::DataInputStream * dis, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

The DataStructure instance that is returned is now the property of the caller.

#### Parameters

<i>dis</i>	- DataInputStream to read from
<i>bs</i>	- BooleanStream to read from

#### Returns

Newly allocated DataStructure Object

#### Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

**6.598.2.34** `virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal ( const activemq::transport::Transport * transport, decaf::io::DataInputStream * in ) throw ( decaf::io::IOException )`  
[virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.

## 6.599 activemq::wireformat::openwire::OpenWireFormatFactory Class Reference

2987

Returns a Pointer to the newly un-marshaled Command.

### Parameters

<i>transport</i>	- Pointer to the transport that is making this request.
<i>in</i>	- the input stream to read the command from.

### Returns

the newly marshaled Command, caller owns the pointer

### Exceptions

<i>IOException</i>	
--------------------	--

Implements **activemq::wireformat::WireFormat** (p. 4091).

### 6.598.3 Field Documentation

**6.598.3.1** `const int activemq::wireformat::openwire::OpenWireFormat::DEFAULT_VERSION = 1` [static, protected]

**6.598.3.2** `const unsigned char activemq::wireformat::openwire::OpenWireFormat::NULL_TYPE` [static, protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireFormat.h`

## 6.599 activemq::wireformat::openwire::OpenWireFormatFactory Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireFormatFactory.h>
```

Inheritance diagram for `activemq::wireformat::openwire::OpenWireFormatFactory`:

### Public Member Functions

- **OpenWireFormatFactory ()**  
*Constructor - Sets Defaults for all properties, these are all subject to change once the createWireFormat method is called.*
- `virtual ~OpenWireFormatFactory ()`
- `virtual Pointer< wireformat::WireFormat > createWireFormat (const decaf::util::Properties &properties) throw ( decaf::lang::exceptions::IllegalStateException )`

*Creates a new **WireFormat** (p. 4088) Object passing it a set of properties from which it can obtain any optional settings.*

### 6.599.1 Constructor & Destructor Documentation

6.599.1.1 `activemq::wireformat::openwire::OpenWireFormatFactory::OpenWireFormatFactory ( ) [inline]`

Constructor - Sets Defaults for all properties, these are all subject to change once the `createWireFormat` method is called.

URL options ----- `wireFormat.stackTraceEnabled` `wireFormat.cacheEnabled`  
`wireFormat.tcpNoDelayEnabled` `wireFormat.tightEncodingEnabled` `wireFormat.sizePrefixDisabled`  
`wireFormat.maxInactivityDuration` `wireFormat.maxInactivityDurationInitialDelay`

6.599.1.2 `virtual activemq::wireformat::openwire::OpenWireFormatFactory::~~OpenWireFormatFactory ( ) [inline, virtual]`

### 6.599.2 Member Function Documentation

6.599.2.1 `virtual Pointer<wireformat::WireFormat> activemq::wireformat::openwire::OpenWireFormatFactory::createWireFormat ( const decaf::util::Properties & properties ) throw ( decaf::lang::exceptions::IllegalStateException ) [virtual]`

Creates a new **WireFormat** (p. 4088) Object passing it a set of properties from which it can obtain any optional settings.

#### Parameters

<i>properties</i>	- the Properties for this <b>WireFormat</b> (p. 4088)
-------------------	---

Implements `activemq::wireformat::WireFormatFactory` (p. 4093).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireFormatFactory.h`

## 6.600 `activemq::wireformat::openwire::OpenWireFormatNegotiator` Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h>
```

Inheritance diagram for `activemq::wireformat::openwire::OpenWireFormatNegotiator`:

## Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** \*wireFormat, const **Pointer**< **transport::Transport** > &next)  
*Constructor - Initializes this object around another Transport.*
- virtual ~**OpenWireFormatNegotiator** ()
- virtual void **oneway** (const **Pointer**< **commands::Command** > &command)  
throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )  
*Sends a one-way command.*
- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )  
*Sends the given request to the server and waits for the response.*
- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command, unsigned int timeout) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )  
*Sends the given request to the server and waits for the response.*
- virtual void **onCommand** (const **Pointer**< **commands::Command** > &command)  
*This is called in the context of the nested transport's reading thread.*
- virtual void **onTransportException** (**transport::Transport** \*source, const **decaf::lang::Exception** &ex)  
*Event handler for an exception from a command transport.*
- virtual void **start** () throw ( decaf::io::IOException )  
*Starts this transport object and creates the thread for polling on the input stream for commands.*
- virtual void **close** () throw ( decaf::io::IOException )  
*Stops the polling thread and closes the streams.*

### 6.600.1 Constructor & Destructor Documentation

#### 6.600.1.1 activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator ( **OpenWireFormat** \* wireFormat, const **Pointer**< **transport::Transport** > & next )

Constructor - Initializes this object around another Transport.

## Parameters

<i>wireFormat</i>	- The <b>WireFormat</b> (p. 4088) object we use to negotiate
<i>next</i>	- The next transport in the chain

**6.600.1.2** `virtual activemq::wireformat::openwire::OpenWireFormatNegotiator::~~OpenWireFormatNegotiator ( ) [virtual]`

## 6.600.2 Member Function Documentation

**6.600.2.1** `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::close ( ) throw ( decaf::io::IOException ) [virtual]`

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

### Exceptions

<i>IOException</i> if errors occur.
-------------------------------------

Reimplemented from `activemq::transport::TransportFilter` (p. 4007).

**6.600.2.2** `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand ( const Pointer< commands::Command > & command ) [virtual]`

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

### Parameters

<i>command</i>	the received from the nested transport.
----------------	---

Reimplemented from `activemq::transport::TransportFilter` (p. 4009).

**6.600.2.3** `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::oneway ( const Pointer< commands::Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

## Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

## Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 4010).

6.600.2.4 **virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onTransportException**  
( **transport::Transport \* source**, **const decaf::lang::Exception & ex** )  
[virtual]

Event handler for an exception from a command transport.

## Parameters

<i>source</i>	The source of the exception
<i>ex</i>	The exception.

6.600.2.5 **virtual Pointer<commands::Response>**  
**activemq::wireformat::openwire::OpenWireFormatNegotiator::request**  
( **const Pointer< commands::Command >**  
**& command** ) **throw ( decaf::io::IOException,**  
**decaf::lang::exceptions::UnsupportedOperationException )**  
[virtual]

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

## Parameters

<i>command</i>	The request to send.
----------------	----------------------

## Returns

the response from the server.

## Exceptions

<i>IOException</i>	if an error occurs with the request.
--------------------	--------------------------------------

Reimplemented from **activemq::transport::TransportFilter** (p. 4011).

```

6.600.2.6  virtual Pointer<commands::Response>
            activemq::wireformat::openwire::OpenWireFormatNegotiator::request
            ( const Pointer< commands::Command > & command,
              unsigned int timeout ) throw ( decaf::io::IOException,
                                              decaf::lang::exceptions::UnsupportedOperationException )
            [virtual]

```

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

#### Parameters

<i>command</i>	The request to send.
<i>timeout</i>	The time to wait for the response.

#### Returns

the response from the server.

#### Exceptions

<i>IOException</i>	if an error occurs with the request.
--------------------	--------------------------------------

Reimplemented from **activemq::transport::TransportFilter** (p. 4011).

```

6.600.2.7  virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::start ( )
            throw ( decaf::io::IOException ) [virtual]

```

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

#### Exceptions

<i>IOException</i>	if an error occurs or if this transport has already been closed.
--------------------	--

Reimplemented from **activemq::transport::TransportFilter** (p. 4012).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireFormatNegotiator.h**

## 6.601 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h>
```

Inheritance diagram for activemq::wireformat::openwire::OpenWireResponseBuilder:

## Public Member Functions

- **OpenWireResponseBuilder** ()
- virtual **~OpenWireResponseBuilder** ()
- virtual **Pointer< commands::Response > buildResponse** (const **Pointer< commands::Command > &command**)

*Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.*

- virtual void **buildIncomingCommands** (const **Pointer< commands::Command > &command**, **decaf::util::StlQueue< Pointer< commands::Command > > &queue**)

*When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

## 6.601.1 Constructor & Destructor Documentation

6.601.1.1 **activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder** ( ) [inline]

6.601.1.2 **virtual activemq::wireformat::openwire::OpenWireResponseBuilder::~~OpenWireResponseBuilder** ( ) [inline, virtual]

## 6.601.2 Member Function Documentation

6.601.2.1 **virtual void activemq::wireformat::openwire::OpenWireResponseBuilder::buildIncomingCommands** ( const **Pointer< commands::Command > &command**, **decaf::util::StlQueue< Pointer< commands::Command > > &queue** ) [virtual]

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

### Parameters

<i>command</i>	- The Command being sent to the Broker.
<i>queue</i>	- Queue of Command sent back from the broker.

Implements **activemq::transport::mock::ResponseBuilder** (p. 3383).

**6.601.2.2** `virtual Pointer<commands::Response>`  
`activemq::wireformat::openwire::OpenWireResponseBuilder::buildResponse ( const`  
`Pointer< commands::Command > & command ) [virtual]`

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

#### Parameters

<i>command</i>	- The command to build a response for
----------------	---------------------------------------

#### Returns

A Response object pointer, or NULL if no response.

Implements `activemq::transport::mock::ResponseBuilder` (p. 3384).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h`

## 6.602 decaf::io::OutputStream Class Reference

Base interface for any class that wants to represent an output stream of bytes.

```
#include <src/main/decaf/io/OutputStream.h>
```

Inheritance diagram for `decaf::io::OutputStream`:

#### Public Member Functions

- **OutputStream** ()
- virtual **~OutputStream** ()
- virtual void **close** () throw ( decaf::io::IOException )  
*Closes this object and deallocates the appropriate resources.  
The object is generally no longer usable after calling close.*

##### Exceptions

<b>IOException</b> (p. 2210)	if an error occurs while closing.
------------------------------	-----------------------------------

- virtual void **flush** () throw ( decaf::io::IOException )  
*Flushes this stream by writing any buffered output to the underlying stream.*

##### Exceptions

<b>IOException</b> (p. 2210)	if an I/O error occurs.
------------------------------	-------------------------

- virtual void **write** (unsigned char c) throw ( decaf::io::IOException )  
*Writes a single byte to the output stream.*
- virtual void **write** (const unsigned char \*buffer, int size) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )  
*Writes an array of bytes to the output stream.*
- virtual void **write** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )  
*Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs.*
- virtual std::string **toString** () const  
*Output a String representation of this object.*
- virtual void **lock** () throw ( decaf::lang::exceptions::RuntimeException )  
*Locks the object.*
- virtual bool **tryLock** () throw ( decaf::lang::exceptions::RuntimeException )  
*Attempts to Lock the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** () throw ( decaf::lang::exceptions::RuntimeException )  
*Unlocks the object.*
- virtual void **wait** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )  
*Waits on a signal from this object, which is generated by a call to Notify.*
- virtual void **wait** (long long millisecs) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )  
*Waits on a signal from this object, which is generated by a call to Notify.*
- virtual void **wait** (long long millisecs, int nanos) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )  
*Waits on a signal from this object, which is generated by a call to Notify.*
- virtual void **notify** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )  
*Signals a waiter on this object that it can now wake up and continue.*
- virtual void **notifyAll** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )

*Signals the waiters on this object that it can now wake up and continue.*

## Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)=0 throw ( decaf::io::IOException )
- virtual void **doWriteArray** (const unsigned char \*buffer, int size) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )
- virtual void **doWriteArrayBounded** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

### 6.602.1 Detailed Description

Base interface for any class that wants to represent an output stream of bytes.

Since

1.0

### 6.602.2 Constructor & Destructor Documentation

6.602.2.1 decaf::io::OutputStream::OutputStream ( )

6.602.2.2 virtual decaf::io::OutputStream::~~OutputStream ( ) [virtual]

### 6.602.3 Member Function Documentation

6.602.3.1 virtual void decaf::io::OutputStream::close ( ) throw ( decaf::io::IOException )  
[virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

#### Exceptions

<b><i>IOException</i></b> (p. 2210)	if an error occurs while closing.
--	-----------------------------------

The default implementation of this method does nothing.

Implements **decaf::io::Closeable** (p. 1181).

Reimplemented in **decaf::internal::io::StandardErrorOutputStream** (p. 3687), **decaf::internal::io::StandardOutputStream** (p. 3690), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2970), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3864), **decaf::io::FilterOutputStream**

(p. 1959), and **decaf::util::zip::DeflaterOutputStream** (p. 1772).

**6.602.3.2** `virtual void decaf::io::OutputStream::doWriteArray ( const unsigned char * buffer, int size ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )`  
[protected, virtual]

Reimplemented in **decaf::io::BufferedOutputStream** (p. 950), and **decaf::io::FilterOutputStream** (p. 1960).

**6.602.3.3** `virtual void decaf::io::OutputStream::doWriteArrayBounded ( const unsigned char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )`  
[protected, virtual]

Reimplemented in **activemq::io::LoggingOutputStream** (p. 2477), **decaf::internal::io::StandardErrorOutputStream** (p. 3687), **decaf::internal::io::StandardOutputStream** (p. 3691), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2971), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3865), **decaf::io::BufferedOutputStream** (p. 950), **decaf::io::ByteArrayOutputStream** (p. 1048), **decaf::io::DataOutputStream** (p. 1630), **decaf::io::FilterOutputStream** (p. 1960), **decaf::util::zip::CheckedOutputStream** (p. 1173), and **decaf::util::zip::DeflaterOutputStream** (p. 1773).

**6.602.3.4** `virtual void decaf::io::OutputStream::doWriteByte ( unsigned char value ) throw ( decaf::io::IOException )` [protected, pure virtual]

Implemented in **activemq::io::LoggingOutputStream** (p. 2477), **decaf::internal::io::StandardErrorOutputStream** (p. 3688), **decaf::internal::io::StandardOutputStream** (p. 3691), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2971), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3865), **decaf::io::BufferedOutputStream** (p. 950), **decaf::io::ByteArrayOutputStream** (p. 1048), **decaf::io::DataOutputStream** (p. 1630), **decaf::io::FilterOutputStream** (p. 1960), **decaf::util::zip::CheckedOutputStream** (p. 1173), and **decaf::util::zip::DeflaterOutputStream** (p. 1773).

**6.602.3.5** `virtual void decaf::io::OutputStream::flush ( ) throw ( decaf::io::IOException )`  
[virtual]

Flushes this stream by writing any buffered output to the underlying stream.

### Exceptions

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

The default implementation of this method does nothing.

Implements **decaf::io::Flushable** (p. 1998).

Reimplemented in **decaf::internal::io::StandardErrorOutputStream** (p. 3688), **decaf::internal::io::StandardOutputStream** (p. 3691), **decaf::io::BufferedOutputStream** (p. 951), and **decaf::io::FilterOutputStream** (p. 1960).

**6.602.3.6** `virtual void decaf::io::OutputStream::lock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [inline, virtual]`

Locks the object.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3812).

**6.602.3.7** `virtual void decaf::io::OutputStream::notify ( ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException ) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

#### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3813).

**6.602.3.8** `virtual void decaf::io::OutputStream::notifyAll ( ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException ) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

#### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3814).

**6.602.3.9** virtual std::string decaf::io::OutputStream::toString ( ) const [virtual]

Output a String representation of this object.

The default version of this method just prints the Class Name.

#### Returns

a string representation of the object.

Reimplemented in **decaf::io::ByteArrayOutputStream** (p. 1049), and **decaf::io::FilterOutputStream** (p. 1961).

**6.602.3.10** virtual bool decaf::io::OutputStream::tryLock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

#### Returns

true if the lock was acquired, false if it is already held by another thread.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3815).

**6.602.3.11** virtual void decaf::io::OutputStream::unlock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [inline, virtual]

Unlocks the object.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3816).

**6.602.3.12** virtual void decaf::io::OutputStream::wait ( ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3818).

**6.602.3.13** `virtual void decaf::io::OutputStream::wait ( long long millisecs ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

**Parameters**

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

**Exceptions**

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3819).

**6.602.3.14** `virtual void decaf::io::OutputStream::wait ( long long millisecs, int nanos ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

**Parameters**

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

**Exceptions**

<i>IllegalArgumentException</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3820).

**6.602.3.15** virtual void decaf::io::OutputStream::write ( unsigned char *c* ) throw ( decaf::io::IOException ) [virtual]

Writes a single byte to the output stream.

The default implementation of this method calls the pure virtual method doWriteByte which must be implemented by any subclass of the **OutputStream** (p. 2991).

**Parameters**

<i>c</i>	The byte to write to the sink.
----------	--------------------------------

**Exceptions**

<i>IOException</i> (p. 2210)	if an I/O error occurs.
---------------------------------	-------------------------

**6.602.3.16** virtual void decaf::io::OutputStream::write ( const unsigned char \* *buffer*, int *size* ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException ) [virtual]

Writes an array of bytes to the output stream.

The entire contents of the given vector are written to the output stream.

The default implementation of this method simply calls the doWriteArray which writes the contents of the array using the doWriteByte method repeatedly. It is recommended that a subclass override doWriteArray to provide more performant means of writing the array.

**Parameters**

<i>buffer</i>	The vector of bytes to write.
<i>size</i>	The size of the buffer passed.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
<i>NullPointerException</i>	thrown if buffer is Null.
<i>IndexOutOfBoundsException</i>	if size value is negative.

**6.602.3.17** `virtual void decaf::io::OutputStream::write ( const unsigned char * buffer,  
int size, int offset, int length ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::NullPointerException,  
decaf::lang::exceptions::IndexOutOfBoundsException )` [virtual]

Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs.

The default implementation of this method simply calls the doWriteArrayBounded method which writes the contents of the array using the doWriteByte method repeatedly. It is recommended that a subclass override doWriteArrayBounded to provide more performant means of writing the array.

**Parameters**

<i>buffer</i>	The array of bytes to write.
<i>size</i>	The size of the buffer array passed.
<i>offset</i>	The position to start writing in buffer.
<i>length</i>	The number of bytes from the buffer to be written.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
<i>NullPointerException</i>	thrown if buffer is Null.
<i>IndexOutOfBoundsException</i>	if the offset + length > size. or one of the parameters is negative.

The documentation for this class was generated from the following file:

- src/main/decaf/io/OutputStream.h

**6.603 decaf::io::OutputStreamWriter Class Reference**

A class for turning a character stream into a byte stream.

```
#include <src/main/decaf/io/OutputStreamWriter.h>
```

Inheritance diagram for decaf::io::OutputStreamWriter:

### Public Member Functions

- **OutputStreamWriter** (**OutputStream** \*stream, bool own=false)  
*Creates a new **OutputStreamWriter** (p. 2999).*
- virtual ~**OutputStreamWriter** ()
- virtual void **close** () throw ( decaf::io::IOException )  
*Closes this object and deallocates the appropriate resources.*
- virtual void **flush** () throw ( decaf::io::IOException )  
*Flushes this stream by writing any buffered output to the underlying stream.*

### Protected Member Functions

- virtual void **doWriteArrayBounded** (const char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )  
*Override this method to customize the functionality of the method write( char\* buffer, int size, int offset, int length ).*
- virtual void **checkClosed** () const throw ( decaf::io::IOException )

#### 6.603.1 Detailed Description

A class for turning a character stream into a byte stream.

See also

**InputStreamReader** (p. 2116)

Since

1.0

#### 6.603.2 Constructor & Destructor Documentation

**6.603.2.1** decaf::io::OutputStreamWriter::OutputStreamWriter ( **OutputStream** \* stream, bool own = false )

Creates a new **OutputStreamWriter** (p. 2999).

### Parameters

<i>stream</i>	The <b>OutputStream</b> (p. 2991) to wrap. (cannot be NULL).
<i>own</i>	Indicates whether this instance own the given <b>OutputStream</b> (p. 2991). If true then the <b>OutputStream</b> (p. 2991) is destroyed when this class is.

### Exceptions

<i>NullPointerException</i>	if the stream is NULL.
-----------------------------	------------------------

6.603.2.2 virtual **decaf::io::OutputStreamWriter::~~OutputStreamWriter** ( ) [virtual]

### 6.603.3 Member Function Documentation

6.603.3.1 virtual void **decaf::io::OutputStreamWriter::checkClosed** ( ) const throw ( **decaf::io::IOException** ) [protected, virtual]

6.603.3.2 virtual void **decaf::io::OutputStreamWriter::close** ( ) throw ( **decaf::io::IOException** ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

### Exceptions

<i>IOException</i> (p. 2210)	if an error occurs while closing.
---------------------------------	-----------------------------------

Implements **decaf::io::Closeable** (p. 1181).

6.603.3.3 virtual void **decaf::io::OutputStreamWriter::doWriteArrayBounded** ( const char \* *buffer*, int *size*, int *offset*, int *length* ) throw ( **decaf::io::IOException**, **decaf::lang::exceptions::NullPointerException**, **decaf::lang::exceptions::IndexOutOfBoundsException** ) [protected, virtual]

Override this method to customize the functionality of the method write( char\* buffer, int size, int offset, int length ).

All subclasses must override this method to provide the basic **Writer** (p. 4133) functionality.

Implements **decaf::io::Writer** (p. 4137).

6.603.3.4 virtual void **decaf::io::OutputStreamWriter::flush** ( ) throw ( **decaf::io::IOException** ) [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

Implements **decaf::io::Flushable** (p. 1998).

The documentation for this class was generated from the following file:

- src/main/decaf/io/OutputStreamWriter.h

**6.604 activemq::commands::PartialCommand Class Reference**

```
#include <src/main/activemq/commands/PartialCommand.h>
```

Inheritance diagram for activemq::commands::PartialCommand:

**Public Member Functions**

- **PartialCommand** ()
- virtual **~PartialCommand** ()
- virtual unsigned char **getDataStructureType** () const  
*Get the unique identifier that this object and its own Marshaler share.*
- virtual **PartialCommand \* cloneDataStructure** () const  
*Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.*
- virtual void **copyDataStructure** (const **DataStructure** \*src)  
*Copy the contents of the passed object into this object's members, overwriting any existing data.*
- virtual std::string **toString** () const  
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** \*value) const  
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual int **getCommandId** () const
- virtual void **setCommandId** (int commandId)
- virtual const std::vector< unsigned char > & **getData** () const
- virtual std::vector< unsigned char > & **getData** ()
- virtual void **setData** (const std::vector< unsigned char > &data)

**Static Public Attributes**

**Protected Attributes**

- int **commandId**
- std::vector< unsigned char > **data**

**6.604.1 Constructor & Destructor Documentation**

6.604.1.1 **activemq::commands::PartialCommand::PartialCommand ( )**

6.604.1.2 **virtual activemq::commands::PartialCommand::~~PartialCommand ( )**  
[virtual]

**6.604.2 Member Function Documentation**

6.604.2.1 **virtual PartialCommand\* activemq::commands::PartialCommand::cloneDataStructure ( ) const** [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

**Returns**

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2372).

6.604.2.2 **virtual void activemq::commands::PartialCommand::copyDataStructure ( const DataStructure \* *src* )** [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

**Parameters**

<i>src</i>	- Source Object
------------	-----------------

Implements **activemq::commands::DataStructure** (p. 1715).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2372).

**6.604.2.3** `virtual bool activemq::commands::PartialCommand::equals ( const DataStructure * value ) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2373).

**6.604.2.4** `virtual int activemq::commands::PartialCommand::getCommandId ( ) const` [virtual]

**6.604.2.5** `virtual std::vector<unsigned char>& activemq::commands::PartialCommand::getData ( )` [virtual]

**6.604.2.6** `virtual const std::vector<unsigned char>& activemq::commands::PartialCommand::getData ( ) const` [virtual]

**6.604.2.7** `virtual unsigned char activemq::commands::PartialCommand::getDataStructureType ( ) const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2373).

**6.604.2.8** `virtual void activemq::commands::PartialCommand::setCommandId ( int commandId ) [virtual]`

**6.604.2.9** `virtual void activemq::commands::PartialCommand::setData ( const std::vector< unsigned char > & data ) [virtual]`

**6.604.2.10** `virtual std::string activemq::commands::PartialCommand::toString ( ) const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2373).

## 6.604.3 Field Documentation

**6.604.3.1** `int activemq::commands::PartialCommand::commandId [protected]`

**6.604.3.2** `std::vector<unsigned char> activemq::commands::PartialCommand::data [protected]`

**6.604.3.3** `const unsigned char activemq::commands::PartialCommand::ID_PARTIALCOMMAND = 60 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/PartialCommand.h`

## 6.605 activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 3005).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/PartialCommandMarshaller.h>
```

### 6.605.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 3005).  
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.605.2 Constructor & Destructor Documentation

6.605.2.1 `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::PartialCommandMarshaller ( ) [inline]`

6.605.2.2 `virtual activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::~~PartialCommandMarshaller ( ) [inline, virtual]`

## 6.605.3 Member Function Documentation

6.605.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller` (p. 2375).

6.605.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller` (p. 2375).

6.605.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides the data sink

## 6.605

**activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller**

**Class Reference**

**3011**

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2375).

**6.605.3.4** virtual void **activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2376).

**6.605.3.5** virtual int **activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2376).

**6.605.3.6** `virtual void activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2377).

**6.605.3.7** `virtual void activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

6.606

**activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller**

**Class Reference**

**3013**

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2377).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/**PartialCommandMarshaller.h**

## 6.606 **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** Class Reference

### 6.606.3 Member Function Documentation

6.606.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::createObject** ( ) **const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2383).

6.606.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

6.606

**activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller**

**Class Reference**

**3015**

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2384).

**6.606.3.3** virtual void **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseMarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut* ) throw ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2384).

**6.606.3.4** virtual void **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 2384).

```
6.606.3.5  virtual int activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1690).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 2385).

```
6.606.3.6  virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.607

**activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller**

### Class Reference

3017

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2385).

```
6.606.3.7 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2386).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**PartialCommandMarshaller.h**

### 6.607.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 3014).  
NOTE!: This file is auto generated - do not modify! if you need to make a change,  
please see the Java Classes in the activemq-openwire-generator module

6.607.2.1 `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::PartialCommandMarshaller ( ) [inline]`

6.607.2.2 `virtual activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::~~PartialCommandMarshaller ( ) [inline, virtual]`

6.607.3 Member Function Documentation

6.607.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller` (p. 2388).

6.607.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller` (p. 2388).

6.607.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- Binary Writer that provides a data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller** (p. 2388).

**6.607.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )` [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller** (p. 2389).

**6.607.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

6.607

**activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller**

**Class Reference**

**3021**

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller** (p. 2389).

**6.607.3.6** `virtual void activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller** (p. 2390).

**6.607.3.7** `virtual void activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i> if an error occurs during the unmarshal.
---

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller** (p. 2390).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/PartialCommandMarshaller.h`

### 6.608.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 3019).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.608.2 Constructor & Destructor Documentation

6.608.2.1 **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::PartialCommandMarshaller**  
( ) [inline]

6.608.2.2 **virtual activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::~~PartialCommandMarshaller**  
( ) [inline, virtual]

### 6.608.3 Member Function Documentation

6.608.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::createObject** ( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2379).

6.608.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::getDataStructureType**  
( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2379).

**6.608.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2380).

**6.608.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

6.608

**activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller**

**Class Reference**

3025

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2380).

6.608.3.5 **virtual int activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal1**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \*  
*dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** )  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2381).

6.608.3.6 **virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal2**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure**  
\* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut*,  
**utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** )  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2381).

```
6.608.3.7 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2382).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/PartialCommandMarshaller.h`

### 6.609.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 3023).  
NOTE!: This file is auto generated - do not modify! if you need to make a change,  
please see the Java Classes in the activemq-openwire-generator module

6.609.2 Constructor & Destructor Documentation

6.609.2.1 `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::PartialCommandMarshaller ( ) [inline]`

6.609.2.2 `virtual activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::~~PartialCommandMarshaller ( ) [inline, virtual]`

6.609.3 Member Function Documentation

6.609.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 2392).

6.609.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 2392).

6.609.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides the data sink

6.609

**activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller**

**Class Reference**

**3029**

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2393).

**6.609.3.4** virtual void **activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2393).

**6.609.3.5** virtual int **activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2393).

```
6.609.3.6  virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2394).

```
6.609.3.7  virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller**

**Class Reference**

**3033**

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 2397).

**6.610.3.3** virtual void **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::looseMarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut* ) throw ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 2397).

**6.610.3.4** virtual void **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2397).

```
6.610.3.5  virtual int activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1690).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2398).

```
6.610.3.6  virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

### 6.611 decaf::lang::Pointer< T, REFCOUNTER > Class Template Reference 3035

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1698).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2398).

```
6.610.3.7 virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1706).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2399).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/PartialCommandMarshaller.h`

### 6.611 decaf::lang::Pointer< T, REFCOUNTER > Class Template Reference

Decaf's implementation of a Smart **Pointer** (p. 3032) that is a template on a Type and is **Thread** (p. 3876) Safe if the default Reference Counter is used.

```
#include <src/main/decaf/lang/Pointer.h>
```

### 6.611.1 Detailed Description

`template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter>`  
`class decaf::lang::Pointer< T, REFCOUNTER >`

Decaf's implementation of a Smart **Pointer** (p. 3032) that is a template on a Type and is **Thread** (p. 3876) Safe if the default Reference Counter is used. This **Pointer** (p. 3032) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 3032) instances in the same manner as normal pointer, except that it does not provide an overload of operators ( <, <=, >, >= ). To allow use of a **Pointer** (p. 3032) in a STL container that requires it, **Pointer** (p. 3032) provides an implementation of `std::less`.

### Since

1.0

## 6.611.2 Member Typedef Documentation

6.611.2.1 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> typedef REFCOUNTER  
decaf::lang::Pointer< T, REFCOUNTER >::CounterType`

6.611.2.2 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> typedef T*  
decaf::lang::Pointer< T, REFCOUNTER >::PointerType`

decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType`

## 6.611.3 Constructor & Destructor Documentation

6.611.3.1 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T,  
REFCOUNTER >::Pointer ( ) [inline]`

Default Constructor.

Initialized the contained pointer to NULL, using the -> operator results in an exception unless reset to contain a real value.

Referenced by `decaf::lang::Pointer< TransactionId >::reset()`.

6.611.3.2 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer<  
T, REFCOUNTER >::Pointer ( const PointerType value ) [inline,  
explicit]`

Explicit Constructor, creates a **Pointer** (p. 3032) that contains value with a single reference.

This object now has ownership until a call to release.

### Parameters

<i>value</i>	- instance of the type we are containing here.
--------------	--

6.611.3.3 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T,  
REFCOUNTER >::Pointer ( const Pointer< T, REFCOUNTER > & value ) throw ()  
[inline]`

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

## 6.611 decaf::lang::Pointer< T, REFCOUNTER > Class Template Reference 3039

6.611.3.4 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 ,  
typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer ( const  
Pointer< T1, R1 > & value ) throw () [inline]`

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.611.3.5 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 ,  
typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer ( const  
Pointer< T1, R1 > & value, const STATIC_CAST_TOKEN & ) throw ()  
[inline]`

Static Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p. 3032) object.

### Parameters

<i>value</i>	- <b>Pointer</b> (p. 3032) instance to cast to this type.
--------------	---

6.611.3.6 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 ,  
typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer ( const  
Pointer< T1, R1 > & value, const DYNAMIC_CAST_TOKEN & ) throw (  
decaf::lang::exceptions::ClassCastException) [inline]`

Dynamic Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p. 3032) object. If the cast fails and return NULL then this method throws a **ClassCastException**.

### Parameters

<i>value</i>	- <b>Pointer</b> (p. 3032) instance to cast to this type.
--------------	---

### Exceptions

<i>ClassCastException</i>	if the dynamic cast returns NULL
---------------------------	----------------------------------

```
6.611.3.7 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> virtual decaf::lang::Pointer<
    T, REFCOUNTER>::~~Pointer( ) throw() [inline, virtual]
```

#### 6.611.4 Member Function Documentation

```
6.611.4.1 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 >
    Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER
    >::dynamicCast( ) const [inline]
```

```
6.611.4.2 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> PointerType
    decaf::lang::Pointer< T, REFCOUNTER>::get( ) const [inline]
```

Gets the real pointer that is contained within this **Pointer** (p. 3032).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL `auto_ptr` and gives access in cases where the caller absolutely needs the real **Pointer** (p. 3032). Use at your own risk.

#### Returns

the contained pointer.

Referenced by `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::equals()`, `activemq::state::ConnectionState::getTransactionState()`, `decaf::lang::operator!=()`, `decaf::lang::Pointer< TransactionId >::operator!=()`, `std::less< decaf::lang::Pointer< T >>::operator()`, `decaf::lang::operator==()`, `decaf::lang::Pointer< TransactionId >::operator==()`, and `activemq::state::ConnectionState::removeTempDestination()`.

```
6.611.4.3 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> bool decaf::lang::Pointer<
    T, REFCOUNTER>::operator!( ) const [inline]
```

```
6.611.4.4 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 ,
    typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator!=(
    const Pointer< T1, R1 > & right ) const [inline]
```

```
6.611.4.5 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType
    decaf::lang::Pointer< T, REFCOUNTER>::operator*( ) const [inline]
```

```
6.611.4.6 template<typename T, typename REFCOUNTER =
    decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType
    decaf::lang::Pointer< T, REFCOUNTER>::operator*( ) [inline]
```

Dereference Operator, returns a reference to the Contained value.

## 6.611 decaf::lang::Pointer< T, REFCOUNTER > Class Template Reference 3041

This method throws an `NullPointerException` if the contained value is `NULL`.

### Returns

reference to the contained pointer.

### Exceptions

<i>NullPointerException</i>	if the contained value is Null
-----------------------------	--------------------------------

```
6.611.4.7  template<typename T, typename REFCOUNTER =  
           decaf::util::concurrent::atomic::AtomicRefCounter> PointerType  
           decaf::lang::Pointer< T, REFCOUNTER >::operator-> ( ) [inline]
```

Indirection Operator, returns a pointer to the Contained value.

This method throws an `NullPointerException` if the contained value is `NULL`.

### Returns

reference to the contained pointer.

### Exceptions

<i>NullPointerException</i>	if the contained value is Null
-----------------------------	--------------------------------

```
6.611.4.8  template<typename T, typename REFCOUNTER =  
           decaf::util::concurrent::atomic::AtomicRefCounter> PointerType  
           decaf::lang::Pointer< T, REFCOUNTER >::operator-> ( ) const [inline]
```

```
6.611.4.9  template<typename T, typename REFCOUNTER =  
           decaf::util::concurrent::atomic::AtomicRefCounter> Pointer&  
           decaf::lang::Pointer< T, REFCOUNTER >::operator= ( const Pointer< T,  
           REFCOUNTER > & right ) throw () [inline]
```

Assigns the value of `right` to this **Pointer** (p. 3032) and increments the reference Count.

### Parameters

<i>right</i>	- <b>Pointer</b> (p. 3032) on the right hand side of an operator= call to this.
--------------	---

```
6.611.4.10  template<typename T, typename REFCOUNTER =
             decaf::util::concurrent::atomic::AtomicRefCount> template<typename T1 ,
             typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator=
             ( const Pointer< T1, R1 > & right ) throw ()  [inline]
```

```
6.611.4.11  template<typename T, typename REFCOUNTER =
             decaf::util::concurrent::atomic::AtomicRefCount> template<typename T1 ,
             typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator== (
             const Pointer< T1, R1 > & right ) const  [inline]
```

```
6.611.4.12  template<typename T, typename REFCOUNTER =
             decaf::util::concurrent::atomic::AtomicRefCount> T* decaf::lang::Pointer< T,
             REFCOUNTER >::release ( )  [inline]
```

Releases the **Pointer** (p. 3032) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 3032) is held by more than one object or this method is called from more than one thread.

#### Parameters

<i>value</i>	- The new value to contain.
--------------	-----------------------------

#### Returns

The pointer instance that was held by this **Pointer** (p. 3032) object, the pointer is no longer owned by this **Pointer** (p. 3032) and won't be freed when this **Pointer** (p. 3032) goes out of scope.

Referenced by decaf::lang::Pointer< TransactionId >::Pointer().

```
6.611.4.13  template<typename T, typename REFCOUNTER =
             decaf::util::concurrent::atomic::AtomicRefCount> void decaf::lang::Pointer<
             T, REFCOUNTER >::reset ( T * value )  [inline]
```

Resets the **Pointer** (p. 3032) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 3032) to a NULL pointer.

#### Parameters

<i>value</i>	- The new value to contain.
--------------	-----------------------------

## 6.612 decaf::lang::PointerComparator< T, R > Class Template Reference 3043

- 6.611.4.14 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 >  
Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER  
>::staticCast ( ) const [inline]`
- 6.611.4.15 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::Pointer<  
T, REFCOUNTER >::swap ( Pointer< T, REFCOUNTER > & value ) throw ()  
[inline]`

**Exception** (p. 1886) Safe Swap Function.

### Parameters

<i>value</i>	- the value to swap with this.
--------------	--------------------------------

Referenced by `decaf::lang::Pointer< TransactionId >::operator=()`, and `decaf::lang::Pointer< TransactionId >::swap()`.

### 6.611.5 Friends And Related Function Documentation

- 6.611.5.1 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> bool operator!= ( const  
Pointer< T, REFCOUNTER > & left, const T * right ) [friend]`
- 6.611.5.2 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> bool operator!= ( const T * left,  
const Pointer< T, REFCOUNTER > & right ) [friend]`
- 6.611.5.3 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> bool operator== ( const  
Pointer< T, REFCOUNTER > & left, const T * right ) [friend]`
- 6.611.5.4 `template<typename T, typename REFCOUNTER =  
decaf::util::concurrent::atomic::AtomicRefCounter> bool operator== ( const T * left,  
const Pointer< T, REFCOUNTER > & right ) [friend]`

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Pointer.h`

## 6.612 decaf::lang::PointerComparator< T, R > Class Template Reference

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 3032) instance.

```
#include <src/main/decaf/lang/Pointer.h>
```

Inheritance diagram for decaf::lang::PointerComparator< T, R >:

## Public Member Functions

- virtual bool **operator()** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const
- virtual int **compare** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const

### 6.612.1 Detailed Description

```
template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCounter> class
decaf::lang::PointerComparator< T, R >
```

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 3032) instance. This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 3032) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

### 6.612.2 Member Function Documentation

```
6.612.2.1 template<typename T , typename R =
decaf::util::concurrent::atomic::AtomicRefCounter> virtual int
decaf::lang::PointerComparator< T, R >::compare ( const Pointer< T, R >
& left, const Pointer< T, R > & right ) const [inline, virtual]
```

```
6.612.2.2 template<typename T , typename R =
decaf::util::concurrent::atomic::AtomicRefCounter> virtual bool
decaf::lang::PointerComparator< T, R >::operator() ( const Pointer< T, R
> & left, const Pointer< T, R > & right ) const [inline, virtual]
```

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Pointer.h**

## 6.613 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

```
#include <src/main/activemq/cmsutil/PooledSession.h>
```

Inheritance diagram for activemq::cmsutil::PooledSession:

## Public Member Functions

- **PooledSession** (**SessionPool** \*pool, **cms::Session** \*session)

*Returns the acknowledgment mode of the session.*
- virtual bool **isTransacted** () const throw ( cms::CMSEException )  
*Gets if the Sessions is a Transacted Session.*
- virtual void **unsubscribe** (const std::string &name) throw ( cms::CMSEException )  
*Unsubscribes a durable subscription that has been created by a client.*

### Protected Member Functions

- **PooledSession** (const **PooledSession** &)
- **PooledSession & operator=** (const **PooledSession** &)

#### 6.613.1 Detailed Description

A pooled session object that wraps around a delegate session. Calls to close this session only result in giving the session back to the pool.

### 6.613.2 Constructor & Destructor Documentation

6.613.2.1 `activemq::cmsutil::PooledSession::PooledSession ( const PooledSession & )`  
[inline, protected]

6.613.2.2 `activemq::cmsutil::PooledSession::PooledSession ( SessionPool * pool, cms::Session * session )`

6.613.2.3 `virtual activemq::cmsutil::PooledSession::~~PooledSession ( )` [virtual]

Does nothing.

### 6.613.3 Member Function Documentation

6.613.3.1 `virtual void activemq::cmsutil::PooledSession::close ( ) throw ( cms::CMSEException )` [virtual]

Returns this session back to the pool, but does not close or destroy the internal session object.

Implements `cms::Session` (p. 3464).

6.613.3.2 `virtual void activemq::cmsutil::PooledSession::commit ( ) throw ( cms::CMSEException )` [inline, virtual]

Commits all messages done in this transaction and releases any locks currently held.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>IllegalStateException</i>	- if the method is not called by a transacted session.

Implements `cms::Session` (p. 3465).

References `cms::Session::commit()`.

6.613.3.3 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser ( const cms::Queue * queue, const std::string & selector ) throw ( cms::CMSEException )` [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

#### Parameters

<i>queue</i>	the Queue to browse
<i>selector</i>	the Message selector to filter which messages are browsed.

**Returns**

New QueueBrowser that is owned by the caller.

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if the destination given is invalid.

Implements **cms::Session** (p. 3466).

**6.613.3.4** virtual **cms::QueueBrowser\*** **activemq::cmsutil::PooledSession::createBrowser** (  
const **cms::Queue** \* *queue* ) throw ( **cms::CMSEException** ) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

**Parameters**

<i>queue</i>	the Queue to browse
--------------	---------------------

**Returns**

New QueueBrowser that is owned by the caller.

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if the destination given is invalid.

Implements **cms::Session** (p. 3465).

**6.613.3.5** virtual **cms::BytesMessage\*** **activemq::cmsutil::PooledSession::createBytesMessage** ( ) throw  
( **cms::CMSEException** ) [inline, virtual]

Creates a BytesMessage.

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3466).

**6.613.3.6** `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage ( const unsigned char * bytes, int bytesSize ) throw ( cms::CMSEException )`  
`[inline, virtual]`

Creates a BytesMessage and sets the payload to the passed value.

#### Parameters

<i>bytes</i>	an array of bytes to set in the message
<i>bytesSize</i>	the size of the bytes array, or number of bytes to use

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3466).

**6.613.3.7** `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer ( const cms::Destination * destination, const std::string & selector, bool noLocal ) throw ( cms::CMSEException )`  
`[virtual]`

First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal.

If created, the consumer is added to the pool's lifecycle manager.

#### Parameters

<i>destination</i>	the destination to receive on
<i>selector</i>	the selector to use
<i>noLocal</i>	whether or not to receive messages from the same connection

#### Returns

the consumer resource

#### Exceptions

<i>cms::CMSEException</i> (p. 1190)	if something goes wrong.
--	--------------------------

**6.613.3.8** `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer ( const cms::Destination * destination ) throw ( cms::CMSEException )`  
`[virtual]`

First checks the internal producer cache and creates one if none exist for the given destination.

If created, the producer is added to the pool's lifecycle manager.

#### Parameters

<i>destination</i>	the destination to send on
--------------------	----------------------------

#### Returns

the producer resource

#### Exceptions

<b><i>cms::CMSEException</i></b> (p. 1190)	if something goes wrong.
---	--------------------------

**6.613.3.9** virtual **cms::MessageConsumer\*** **activemq::cmsutil::PooledSession::createConsumer** ( const **cms::Destination** \* *destination* ) throw ( **cms::CMSEException** ) [inline, virtual]

Creates a MessageConsumer for the specified destination.

#### Parameters

<i>destination</i>	the Destination that this consumer receiving messages for.
--------------------	--

#### Returns

pointer to a new MessageConsumer that is owned by the caller ( caller deletes )

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if an invalid destination is specified.

Implements **cms::Session** (p. 3467).

**6.613.3.10** virtual **cms::MessageConsumer\*** **activemq::cmsutil::PooledSession::createConsumer** ( const **cms::Destination** \* *destination*, const std::string & *selector* ) throw ( **cms::CMSEException** ) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

#### Parameters

<i>destination</i>	the Destination that this consumer receiving messages for.
<i>selector</i>	the Message Selector to use

**Returns**

pointer to a new MessageConsumer that is owned by the caller ( caller deletes )

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if an invalid destination is specified.
<i>InvalidSelectorException</i>	- if the message selector is invalid.

Implements **cms::Session** (p. 3467).

```
6.613.3.11 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer ( const
cms::Destination * destination, const std::string & selector, bool noLocal )
throw ( cms::CMSEException ) [inline, virtual]
```

Creates a MessageConsumer for the specified destination, using a message selector.

**Parameters**

<i>destination</i>	the Destination that this consumer receiving messages for.
<i>selector</i>	the Message Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

**Returns**

pointer to a new MessageConsumer that is owned by the caller ( caller deletes )

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if an invalid destination is specified.
<i>InvalidSelectorException</i>	- if the message selector is invalid.

Implements **cms::Session** (p. 3468).

```
6.613.3.12 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createDurableConsumer (
const cms::Topic * destination, const std::string & name, const std::string &
selector, bool noLocal = false ) throw ( cms::CMSEException ) [inline,
virtual]
```

Creates a durable subscriber to the specified topic, using a Message selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

#### Parameters

<i>destination</i>	the topic to subscribe to
<i>name</i>	The name used to identify the subscription
<i>selector</i>	the Message Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

#### Returns

pointer to a new durable MessageConsumer that is owned by the caller ( caller deletes )

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if an invalid destination is specified.
<i>InvalidSelectorException</i>	- if the message selector is invalid.

Implements **cms::Session** (p. 3469).

**6.613.3.13** virtual **cms::MapMessage\*** **activemq::cmsutil::PooledSession::createMapMessage ( )** throw (**cms::CMSEException**) [inline, virtual]

Creates a new MapMessage.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3469).

**6.613.3.14** virtual **cms::Message\*** **activemq::cmsutil::PooledSession::createMessage ( )** throw (**cms::CMSEException**) [inline, virtual]

Creates a new Message.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3470).

**6.613.3.15** `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer ( const cms::Destination * destination ) throw ( cms::CMSEException )` `[inline, virtual]`

Creates a MessageProducer to send messages to the specified destination.

#### Parameters

<i>destination</i>	the Destination to send on
--------------------	----------------------------

#### Returns

New MessageProducer that is owned by the caller.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if an invalid destination is specified.

Implements **cms::Session** (p. 3470).

**6.613.3.16** `virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue ( const std::string & queueName ) throw ( cms::CMSEException )` `[inline, virtual]`

Creates a queue identity given a Queue name.

#### Parameters

<i>queueName</i>	the name of the new Queue
------------------	---------------------------

#### Returns

new Queue pointer that is owned by the caller.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3470).

**6.613.3.17** virtual cms::StreamMessage\* activemq::cmsutil::PooledSession::createStreamMessage ( )  
throw ( cms::CMSEException ) [inline, virtual]

Creates a new StreamMessage.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements cms::Session (p. 3471).

**6.613.3.18** virtual cms::TemporaryQueue\* activemq::cmsutil::PooledSession::createTemporaryQueue ( )  
throw ( cms::CMSEException ) [inline, virtual]

Creates a TemporaryQueue object.

#### Returns

new TemporaryQueue pointer that is owned by the caller.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements cms::Session (p. 3471).

**6.613.3.19** virtual cms::TemporaryTopic\* activemq::cmsutil::PooledSession::createTemporaryTopic ( )  
throw ( cms::CMSEException ) [inline, virtual]

Creates a TemporaryTopic object.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements cms::Session (p. 3471).

**6.613.3.20** virtual cms::TextMessage\* activemq::cmsutil::PooledSession::createTextMessage ( const  
std::string & text ) throw ( cms::CMSEException ) [inline, virtual]

Creates a new TextMessage and set the text to the value given.

#### Parameters

<i>text</i>	the initial text for the message
-------------	----------------------------------

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3472).

**6.613.3.21** `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage ( ) throw ( cms::CMSEException ) [inline, virtual]`

Creates a new TextMessage.

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3472).

**6.613.3.22** `virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic ( const std::string & topicName ) throw ( cms::CMSEException ) [inline, virtual]`

Creates a topic identity given a Queue name.

**Parameters**

<i>topicName</i>	the name of the new Topic
------------------	---------------------------

**Returns**

new Topic pointer that is owned by the caller.

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3472).

**6.613.3.23** `virtual cms::Session::AcknowledgeMode activemq::cmsutil::PooledSession::getAcknowledgeMode ( ) const throw ( cms::CMSEException ) [inline, virtual]`

Returns the acknowledgment mode of the session.

**Returns**

the Sessions Acknowledge Mode

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3473).

**6.613.3.24** `virtual cms::Session* activemq::cmsutil::PooledSession::getSession ( )`  
`[inline, virtual]`

Returns a non-constant reference to the internal session object.

**Returns**

the session object.

**6.613.3.25** `virtual const cms::Session* activemq::cmsutil::PooledSession::getSession ( )`  
`const [inline, virtual]`

Returns a constant reference to the internal session object.

**Returns**

the session object.

**6.613.3.26** `virtual bool activemq::cmsutil::PooledSession::isTransacted ( ) const throw (`  
`cms::CMSEException) [inline, virtual]`

Gets if the Sessions is a Transacted Session.

**Returns**

transacted true - false.

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3473).

**6.613.3.27** `PooledSession& activemq::cmsutil::PooledSession::operator= ( const`  
`PooledSession & ) [inline, protected]`

**6.613.3.28** `virtual void activemq::cmsutil::PooledSession::recover ( ) throw (`  
`cms::CMSEException) [inline, virtual]`

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "re-delivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

#### Exceptions

<i>CMSEException</i>	- if the CMS provider fails to stop and restart message delivery due to some internal error.
<i>IllegalStateException</i>	- if the method is called by a transacted session.

Implements **cms::Session** (p. 3474).

**6.613.3.29** `virtual void activemq::cmsutil::PooledSession::rollback ( ) throw ( cms::CMSEException ) [inline, virtual]`

Rolls back all messages done in this transaction and releases any locks currently held.

#### Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>IllegalStateException</i>	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 3474).

**6.613.3.30** `virtual void activemq::cmsutil::PooledSession::unsubscribe ( const std::string & name ) throw ( cms::CMSEException ) [inline, virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

#### Parameters

<i>name</i>	The name used to identify this subscription
-------------	---

**Exceptions**

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 3475).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**PooledSession.h**

**6.614 decaf::util::concurrent::PooledThread Class Reference**

```
#include <src/main/decaf/util/concurrent/PooledThread.h>
```

Inheritance diagram for decaf::util::concurrent::PooledThread:

**Public Member Functions**

- **PooledThread** (**ThreadPool** \*pool)

*Constructor.*

- virtual **~PooledThread** ()
- virtual void **run** ()

*Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 3888) and then grabs it and calls its run method.*

- virtual void **stop** () throw ( lang::Exception )

*Stops the Thread, thread will complete its task if currently running one, and then die.*

- virtual bool **isBusy** ()

*Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.*

- virtual void **setPooledThreadListener** (**PooledThreadListener** \*listener)

*Adds a listener to this **PooledThread** (p. 3056) to be notified when this thread starts and completes a task.*

- virtual **PooledThreadListener** \* **getPooledThreadListener** ()

*Removes a listener for this **PooledThread** (p. 3056) to be notified when this thread starts and completes a task.*

### 6.614.1 Constructor & Destructor Documentation

#### 6.614.1.1 `decaf::util::concurrent::PooledThread::PooledThread ( ThreadPool * pool )`

Constructor.

##### Parameters

<i>pool</i>	the parant <b>ThreadPool</b> (p. 3888) object
-------------	---

#### 6.614.1.2 `virtual decaf::util::concurrent::PooledThread::~~PooledThread ( ) [virtual]`

### 6.614.2 Member Function Documentation

#### 6.614.2.1 `virtual PooledThreadListener* decaf::util::concurrent::PooledThread::getPooledThreadListener ( ) [inline, virtual]`

Removes a listener for this **PooledThread** (p. 3056) to be notified when this thread starts and completes a task.

##### Returns

a pointer to this thread's listener or NULL

#### 6.614.2.2 `virtual bool decaf::util::concurrent::PooledThread::isBusy ( ) [inline, virtual]`

Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.

##### Returns

true if the Thread is busy

#### 6.614.2.3 `virtual void decaf::util::concurrent::PooledThread::run ( ) [virtual]`

Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 3888) and then grabs it and calls its run method.

Reimplemented from **decaf::lang::Thread** (p. 3884).

#### 6.614.2.4 `virtual void decaf::util::concurrent::PooledThread::setPooledThreadListener ( PooledThreadListener * listener ) [inline, virtual]`

Adds a listener to this **PooledThread** (p. 3056) to be notified when this thread starts and completes a task.

**Parameters**

<i>listener</i>	the listener to send notifications to.
-----------------	--

**6.614.2.5** virtual void decaf::util::concurrent::PooledThread::stop ( ) throw ( lang::Exception ) [virtual]

Stops the Thread, thread will complete its task if currently running one, and then die.

Does not block.

**Exceptions**

<i>Exception</i>	
------------------	--

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**PooledThread.h**

**6.615 decaf::util::concurrent::PooledThreadListener Class Reference**

Abstract Listener Interface for users of **ThreadPool** (p. 3888).

```
#include <src/main/decaf/util/concurrent/PooledThreadListener.h>
```

Inheritance diagram for decaf::util::concurrent::PooledThreadListener:

**Public Member Functions**

- virtual ~**PooledThreadListener** ()
- virtual void **onTaskStarted** (**PooledThread** \*thread)=0  
*Called by a pooled thread when it is about to begin executing a new task.*
- virtual void **onTaskCompleted** (**PooledThread** \*thread)=0  
*Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.*
- virtual void **onTaskException** (**PooledThread** \*thread, lang::Exception &ex)=0  
*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 3056) is now no longer running.*

### 6.615.1 Detailed Description

Abstract Listener Interface for users of **ThreadPool** (p. 3888). The implementor of this class receives events related to the execution and termination of threads running in the **ThreadPool** (p. 3888).

Since

1.0

### 6.615.2 Constructor & Destructor Documentation

6.615.2.1 `virtual decaf::util::concurrent::PooledThreadListener::~~PooledThreadListener ( )`  
[inline, virtual]

### 6.615.3 Member Function Documentation

6.615.3.1 `virtual void decaf::util::concurrent::PooledThreadListener::onTaskCompleted ( PooledThread * thread )` [pure virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

Parameters

<i>thread</i>	- Pointer the the Pooled Thread that is making this call.
---------------	---

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3892).

6.615.3.2 `virtual void decaf::util::concurrent::PooledThreadListener::onTaskException ( PooledThread * thread, lang::Exception & ex )` [pure virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 3056) is now no longer running.

Parameters

<i>thread</i>	- Pointer to the Pooled Thread that is making this call
<i>ex</i>	- The Exception that occurred.

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3893).

6.615.3.3 `virtual void decaf::util::concurrent::PooledThreadListener::onTaskStarted ( PooledThread * thread )` [pure virtual]

Called by a pooled thread when it is about to begin executing a new task.

**Parameters**

<i>thread</i>	- Pointer to the Pooled Thread that is making this call
---------------	---

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3893).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**PooledThreadListener.h**

**6.616 decaf::net::PortUnreachableException Class Reference**

```
#include <src/main/decaf/net/PortUnreachableException.h>
```

Inheritance diagram for decaf::net::PortUnreachableException:

**Public Member Functions**

- **PortUnreachableException** () throw ()

*Default Constructor.*

- **PortUnreachableException** (const Exception &ex) throw ()

*Conversion Constructor from some other Exception.*

- **PortUnreachableException** (const **PortUnreachableException** &ex) throw ()

*Copy Constructor.*

- **PortUnreachableException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()

*Constructor - Initializes the file name and line number where this message occurred.*

- **PortUnreachableException** (const std::exception \*cause) throw ()

*Constructor.*

- **PortUnreachableException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()

*Constructor - Initializes the file name and line number where this message occurred.*

- virtual **PortUnreachableException** \* **clone** () const

*Clones this exception.*

- virtual ~**PortUnreachableException** () throw ()

### 6.616.1 Constructor & Destructor Documentation

**6.616.1.1** `decaf::net::PortUnreachableException::PortUnreachableException ( ) throw ()`  
[inline]

Default Constructor.

**6.616.1.2** `decaf::net::PortUnreachableException::PortUnreachableException ( const Exception & ex ) throw ()` [inline]

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.616.1.3** `decaf::net::PortUnreachableException::PortUnreachableException ( const PortUnreachableException & ex ) throw ()` [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.616.1.4** `decaf::net::PortUnreachableException::PortUnreachableException ( const char * file, const int lineNumber, const std::exception * cause, const char * msg, ... ) throw ()`  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.616.1.5** `decaf::net::PortUnreachableException::PortUnreachableException ( const std::exception * cause ) throw ()` [inline]

Constructor.

**Parameters**

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.616.1.6** `decaf::net::PortUnreachableException::PortUnreachableException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.616.1.7** `virtual decaf::net::PortUnreachableException::~~PortUnreachableException ( ) throw () [inline, virtual]`

**6.616.2 Member Function Documentation**

**6.616.2.1** `virtual PortUnreachableException* decaf::net::PortUnreachableException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

**Returns**

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 3629).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/PortUnreachableException.h`

**6.617 activemq::core::PrefetchPolicy Class Reference**

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

```
#include <src/main/activemq/core/PrefetchPolicy.h>
```

Inheritance diagram for `activemq::core::PrefetchPolicy`:

### Public Member Functions

- virtual `~PrefetchPolicy ()`
- virtual void `setDurableTopicPrefetch (int value)=0`  
*Sets the amount of prefetched messages for a Durable Topic.*
- virtual int `getDurableTopicPrefetch () const =0`  
*Gets the amount of messages to prefetch for a Durable Topic.*
- virtual void `setQueuePrefetch (int value)=0`  
*Sets the amount of prefetched messages for a Queue.*
- virtual int `getQueuePrefetch () const =0`  
*Gets the amount of messages to prefetch for a Queue.*
- virtual void `setQueueBrowserPrefetch (int value)=0`  
*Sets the amount of prefetched messages for a Queue Browser.*
- virtual int `getQueueBrowserPrefetch () const =0`  
*Gets the amount of messages to prefetch for a Queue Browser.*
- virtual void `setTopicPrefetch (int value)=0`  
*Sets the amount of prefetched messages for a Topic.*
- virtual int `getTopicPrefetch () const =0`  
*Gets the amount of messages to prefetch for a Topic.*
- virtual int `getMaxPrefetchLimit (int value) const =0`  
*Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.*
- virtual `PrefetchPolicy * clone () const =0`  
*Clone the Policy and return a new pointer to that clone.*
- virtual void `configure (const decaf::util::Properties &properties)`  
*Checks the supplied properties object for properties matching the configurable settings of this class.*

### Protected Member Functions

- `PrefetchPolicy ()`

### 6.617.1 Detailed Description

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

#### Since

3.2.0

### 6.617.2 Constructor & Destructor Documentation

**6.617.2.1** `activemq::core::PrefetchPolicy::PrefetchPolicy ( )` `[protected]`

**6.617.2.2** `virtual activemq::core::PrefetchPolicy::~~PrefetchPolicy ( )` `[virtual]`

### 6.617.3 Member Function Documentation

**6.617.3.1** `virtual PrefetchPolicy* activemq::core::PrefetchPolicy::clone ( ) const` `[pure virtual]`

Clone the Policy and return a new pointer to that clone.

#### Returns

pointer to a new **PrefetchPolicy** (p. 3062) instance that is a clone of this one.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1727).

**6.617.3.2** `virtual void activemq::core::PrefetchPolicy::configure ( const decaf::util::Properties & properties )` `[virtual]`

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix `cms.PrefetchPolicy.XXX` where XXX is the name of a property with a public setter method. For instance `cms.PrefetchPolicy.topicPrefetch` will be used to set the value of the topic prefetch limit.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

#### Parameters

<i>properties</i>	The Properties object used to configure this object.
-------------------	--

#### Exceptions

<i>NumberFormatException</i>	if a property that is numeric cannot be converted
------------------------------	---

<i>IllegalArgumentEx- ception</i>	if a property can't be converted to the correct type.
---------------------------------------	---

**6.617.3.3** `virtual int activemq::core::PrefetchPolicy::getDurableTopicPrefetch ( ) const`  
`[pure virtual]`

Gets the amount of messages to prefetch for a Durable Topic.

#### Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1728).

**6.617.3.4** `virtual int activemq::core::PrefetchPolicy::getMaxPrefetchLimit ( int value ) const`  
`[pure virtual]`

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

#### Returns

the allowable value for a prefetch limit, either requested or the max.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1728).

**6.617.3.5** `virtual int activemq::core::PrefetchPolicy::getQueueBrowserPrefetch ( ) const`  
`[pure virtual]`

Gets the amount of messages to prefetch for a Queue Browser.

#### Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1728).

**6.617.3.6** `virtual int activemq::core::PrefetchPolicy::getQueuePrefetch ( ) const` `[pure virtual]`

Gets the amount of messages to prefetch for a Queue.

#### Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1728).

**6.617.3.7** `virtual int activemq::core::PrefetchPolicy::getTopicPrefetch ( ) const` `[pure virtual]`

Gets the amount of messages to prefetch for a Topic.

#### Returns

value of the number of messages to prefetch.

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1729).

**6.617.3.8** `virtual void activemq::core::PrefetchPolicy::setDurableTopicPrefetch ( int value )` `[pure virtual]`

Sets the amount of prefetched messages for a Durable Topic.

#### Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1729).

**6.617.3.9** `virtual void activemq::core::PrefetchPolicy::setQueueBrowserPrefetch ( int value )` `[pure virtual]`

Sets the amount of prefetched messages for a Queue Browser.

#### Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1729).

**6.617.3.10** `virtual void activemq::core::PrefetchPolicy::setQueuePrefetch ( int value )` `[pure virtual]`

Sets the amount of prefetched messages for a Queue.

#### Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1729).

**6.617.3.11** `virtual void activemq::core::PrefetchPolicy::setTopicPrefetch ( int value )` [pure virtual]

Sets the amount of prefetched messages for a Topic.

#### Parameters

<i>value</i>	The number of messages to prefetch.
--------------	-------------------------------------

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1730).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/PrefetchPolicy.h`

## 6.618 activemq::util::PrimitiveList Class Reference

List of primitives.

```
#include <src/main/activemq/util/PrimitiveList.h>
```

Inheritance diagram for `activemq::util::PrimitiveList`:

### Public Member Functions

- **PrimitiveList** ()

*Default Constructor; creates an Empty list.*

- virtual **~PrimitiveList** ()

- **PrimitiveList** (const **decaf::util::List**< **PrimitiveValueNode** > &src)

*Copy Constructor.*

- **PrimitiveList** (const **PrimitiveList** &src)

*Copy Constructor.*

- std::string **toString** () const

*Converts the contents into a formatted string that can be output in a Log File or other debugging tool.*

- virtual bool **getBool** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Boolean value at the specified index.*

- virtual void **setBool** (std::size\_t index, bool value) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )

*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*

- virtual unsigned char **getByte** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Byte value at the specified index.*

- virtual void **setByte** (std::size\_t index, unsigned char value) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )

*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*

- virtual char **getChar** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Character value at the specified index.*

*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*

- virtual short **getShort** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Short value at the specified index.*

- virtual void **setShort** (std::size\_t index, short value) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )

*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*

- virtual int **getInt** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Integer value at the specified index.*

- virtual void **setInt** (std::size\_t index, int value) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )

*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*

- virtual long long **getLong** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Long value at the specified index.*

- virtual void **setLong** (std::size\_t index, long long value) throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
)  
*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*
- virtual float **getFloat** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the Float value at the specified index.*
- virtual void **setFloat** (std::size\_t index, float value) throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
)  
*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*
- virtual double **getDouble** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the Double value at the specified index.*
- virtual void **setDouble** (std::size\_t index, double value) throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
)  
*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*
- virtual std::string **getString** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the String value at the specified index.*
- virtual void **setString** (std::size\_t index, const std::string &value) throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
)  
*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*
- virtual std::vector< unsigned char > **getByteArray** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the Byte Array value at the specified index.*
- virtual void **setByteArray** (std::size\_t index, const std::vector< unsigned char > &value) throw ( decaf::lang::exceptions::IndexOutOfBoundsEx  
)  
*Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.*

### 6.618.1 Detailed Description

List of primitives.

### 6.618.2 Constructor & Destructor Documentation

#### 6.618.2.1 `activemq::util::PrimitiveList::PrimitiveList ( )`

Default Constructor, creates an Empty list.

#### 6.618.2.2 `virtual activemq::util::PrimitiveList::~~PrimitiveList ( ) [virtual]`

#### 6.618.2.3 `activemq::util::PrimitiveList::PrimitiveList ( const decaf::util::List< PrimitiveValueNode > & src )`

Copy Constructor.

##### Parameters

<i>src</i>	- the Decaf List of PrimitiveNodeValues to copy
------------	---

#### 6.618.2.4 `activemq::util::PrimitiveList::PrimitiveList ( const PrimitiveList & src )`

Copy Constructor.

##### Parameters

<i>src</i>	- the <b>PrimitiveList</b> (p. 3067) to copy
------------	--

### 6.618.3 Member Function Documentation

#### 6.618.3.1 `virtual bool activemq::util::PrimitiveList::getBool ( std::size_t index ) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]`

Gets the Boolean value at the specified index.

##### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

##### Returns

value contained at the given index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.2** `virtual unsigned char activemq::util::PrimitiveList::getBytes ( std::size_t index )  
const throw ( decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Byte value at the specified index.

**Parameters**

<i>index</i>	- index to get value from
--------------	---------------------------

**Returns**

value contained at the given index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.3** `virtual std::vector<unsigned char> activemq::util::PrimitiveList::getBytesArray  
( std::size_t index ) const throw ( de-  
cafe::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Byte Array value at the specified index.

**Parameters**

<i>index</i>	- index to get value from
--------------	---------------------------

**Returns**

value contained at the given index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
----------------------------------	---------------------------------------

<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.
--------------------------------------	--

**6.618.3.4** `virtual char activemq::util::PrimitiveList::getChar ( std::size_t index ) const  
throw ( decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Character value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.5** `virtual double activemq::util::PrimitiveList::getDouble ( std::size_t index )  
const throw ( decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Double value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.6** `virtual float activemq::util::PrimitiveList::getFloat ( std::size_t index ) const`  
`throw ( decaf::lang::exceptions::IndexOutOfBoundsException,`  
`decaf::lang::exceptions::UnsupportedOperationException )`  
`[virtual]`

Gets the Float value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.7** `virtual int activemq::util::PrimitiveList::getInt ( std::size_t index ) const`  
`throw ( decaf::lang::exceptions::IndexOutOfBoundsException,`  
`decaf::lang::exceptions::UnsupportedOperationException )`  
`[virtual]`

Gets the Integer value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.8** `virtual long long activemq::util::PrimitiveList::getLong ( std::size_t index )  
const throw ( decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Long value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.9** `virtual short activemq::util::PrimitiveList::getShort ( std::size_t index ) const  
throw ( decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Short value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.10** `virtual std::string activemq::util::PrimitiveList::getString ( std::size_t index )  
const throw ( decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the String value at the specified index.

#### Parameters

<i>index</i>	- index to get value from
--------------	---------------------------

#### Returns

value contained at the given index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > <b>size()</b> (p. 3708)
<i>UnsupportedOperationException</i>	if the type at index is not of the type that this method is to return or can convert to.

**6.618.3.11** `virtual void activemq::util::PrimitiveList::setBool ( std::size_t index, bool value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )  
[virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

#### Parameters

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.12** `virtual void activemq::util::PrimitiveList::setByte ( std::size_t index, unsigned char value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )  
[virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

**Parameters**

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.13** `virtual void activemq::util::PrimitiveList::setByteArray ( std::size_t index, const std::vector< unsigned char > & value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException ) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

**Parameters**

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.14** `virtual void activemq::util::PrimitiveList::setChar ( std::size_t index, char value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException ) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

**Parameters**

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.15** `virtual void activemq::util::PrimitiveList::setDouble ( std::size_t index, double value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )`  
[virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

#### Parameters

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.16** `virtual void activemq::util::PrimitiveList::setFloat ( std::size_t index, float value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )`  
[virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

#### Parameters

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.17** `virtual void activemq::util::PrimitiveList::setInt ( std::size_t index, int value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )` [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

#### Parameters

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.18** virtual void activemq::util::PrimitiveList::setLong ( std::size\_t *index*, long long *value* ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )  
[virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

**Parameters**

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.19** virtual void activemq::util::PrimitiveList::setShort ( std::size\_t *index*, short *value* ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )  
[virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

**Parameters**

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

**Exceptions**

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

**6.618.3.20** virtual void activemq::util::PrimitiveList::setString ( std::size\_t *index*, const std::string & *value* ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException ) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the

index is greater than the size of the list.

#### Parameters

<i>index</i>	- location to set in the list
<i>value</i>	- the new value to assign to the element at index

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index > <b>size()</b> (p. 3708).
----------------------------------	-------------------------------------

#### 6.618.3.21 `std::string activemq::util::PrimitiveList::toString ( ) const`

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

#### Returns

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveList.h`

### 6.619 `activemq::util::PrimitiveMap` Class Reference

Map of named primitives.

```
#include <src/main/activemq/util/PrimitiveMap.h>
```

Inheritance diagram for `activemq::util::PrimitiveMap`:

#### Public Member Functions

- **PrimitiveMap** ()  
*Default Constructor; creates an empty map.*
- virtual **~PrimitiveMap** ()
- **PrimitiveMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &source)  
*Copy Constructor.*
- **PrimitiveMap** (const **PrimitiveMap** &source)  
*Copy Constructor.*

- std::string **toString** () const

*Converts the contents into a formatted string that can be output in a Log File or other debugging tool.*

- virtual bool **getBool** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*

- virtual void **setBool** (const std::string &key, bool value)

*Sets the value at key to the specified type.*

- virtual unsigned char **getByte** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*

- virtual void **setByte** (const std::string &key, unsigned char value)

*Sets the value at key to the specified type.*

- virtual char **getChar** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*

- virtual void **setChar** (const std::string &key, char value)

*Sets the value at key to the specified type.*

- virtual short **getShort** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*

- virtual void **setShort** (const std::string &key, short value)

*Sets the value at key to the specified type.*

- virtual int **getInt** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )

*Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*

- virtual void **setInt** (const std::string &key, int value)

*Sets the value at key to the specified type.*

- virtual long long **getLong** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*
- virtual void **setLong** (const std::string &key, long long value)  
*Sets the value at key to the specified type.*
- virtual float **getFloat** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*
- virtual void **setFloat** (const std::string &key, float value)  
*Sets the value at key to the specified type.*
- virtual double **getDouble** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElementException  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*
- virtual void **setDouble** (const std::string &key, double value)  
*Sets the value at key to the specified type.*
- virtual std::string **getString** (const std::string &key) const throw ( decaf::lang::exceptions::NoSuchElement  
decaf::lang::exceptions::UnsupportedOperationException )  
*Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*
- virtual void **setString** (const std::string &key, const std::string &value)  
*Sets the value at key to the specified type.*
- virtual std::vector< unsigned char > **getByteArray** (const std::string &key)  
const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOp  
)  
*Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.*
- virtual void **setByteArray** (const std::string &key, const std::vector< unsigned  
char > &value)  
*Sets the value at key to the specified type.*

### 6.619.1 Detailed Description

Map of named primitives.

## 6.619.2 Constructor & Destructor Documentation

### 6.619.2.1 activemq::util::PrimitiveMap::PrimitiveMap ( )

Default Constructor, creates an empty map.

### 6.619.2.2 virtual activemq::util::PrimitiveMap::~~PrimitiveMap ( ) [virtual]

### 6.619.2.3 activemq::util::PrimitiveMap::PrimitiveMap ( const decaf::util::Map< std::string, PrimitiveValueNode > & source )

Copy Constructor.

#### Parameters

<i>source</i>	The Decaf Library Map instance whose elements will be copied into this Map.
---------------	---

### 6.619.2.4 activemq::util::PrimitiveMap::PrimitiveMap ( const PrimitiveMap & source )

Copy Constructor.

#### Parameters

<i>source</i>	The <b>PrimitiveMap</b> (p. 3079) whose elements will be copied into this Map.
---------------	--

## 6.619.3 Member Function Documentation

### 6.619.3.1 virtual bool activemq::util::PrimitiveMap::getBool ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
-------------------------------	---------------------------

<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns
--------------------------------------	--

**6.619.3.2** `virtual unsigned char activemq::util::PrimitiveMap::getByte ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )`  
 [virtual]

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.3** `virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getByteArray ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )`  
 [virtual]

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
-------------------------------	---------------------------

<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns
--------------------------------------	--

**6.619.3.4** `virtual char activemq::util::PrimitiveMap::getChar ( const std::string & key )  
const throw ( decaf::lang::exceptions::NoSuchElementException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.5** `virtual double activemq::util::PrimitiveMap::getDouble ( const std::string & key  
) const throw ( decaf::lang::exceptions::NoSuchElementException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.6** `virtual float activemq::util::PrimitiveMap::getFloat ( const std::string & key )  
const throw ( decaf::lang::exceptions::NoSuchElementException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.7** `virtual int activemq::util::PrimitiveMap::getInt ( const std::string & key )  
const throw ( decaf::lang::exceptions::NoSuchElementException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.8** virtual long long activemq::util::PrimitiveMap::getLong ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.9** virtual short activemq::util::PrimitiveMap::getShort ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnsupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.10** `virtual std::string activemq::util::PrimitiveMap::getString ( const std::string & key )  
const throw ( decaf::lang::exceptions::NoSuchElementException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

#### Parameters

<i>key</i>	- the location to return the value from.
------------	--

#### Returns

the value at key in the type requested.

#### Exceptions

<i>NoSuchElementException</i>	if key is not in the map.
<i>UnSupportedOperationException</i>	if the value cannot be converted to the type this method returns

**6.619.3.11** `virtual void activemq::util::PrimitiveMap::setBool ( const std::string & key, bool  
value ) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.12** `virtual void activemq::util::PrimitiveMap::setByte ( const std::string & key, unsigned  
char value ) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.13** `virtual void activemq::util::PrimitiveMap::setByteArray ( const std::string & key,  
const std::vector< unsigned char > & value ) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.14** `virtual void activemq::util::PrimitiveMap::setChar ( const std::string & key, char  
value ) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.15** `virtual void activemq::util::PrimitiveMap::setDouble ( const std::string & key, double  
value ) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.16** `virtual void activemq::util::PrimitiveMap::setFloat ( const std::string & key, float  
value ) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.17** `virtual void activemq::util::PrimitiveMap::setInt ( const std::string & key, int value )`  
[virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.18** `virtual void activemq::util::PrimitiveMap::setLong ( const std::string & key, long long value )`  
[virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.19** `virtual void activemq::util::PrimitiveMap::setShort ( const std::string & key, short value )`  
[virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

**6.619.3.20** `virtual void activemq::util::PrimitiveMap::setString ( const std::string & key, const std::string & value )`  
[virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

#### Parameters

<i>key</i>	- the map key to set or insert.
<i>value</i>	- the new value to set at the key location.

#### 6.619.3.21 std::string activemq::util::PrimitiveMap::toString ( ) const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

#### Returns

formatted String of all elements in the map.

## 6.620.1 Detailed Description

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

## 6.620.2 Constructor & Destructor Documentation

- 6.620.2.1    `activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::PrimitiveTypesMarshaller`  
           ( ) [inline]
- 6.620.2.2    `virtual activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~~PrimitiveTypesMarshaller`  
           ( ) [inline, virtual]

## 6.620.3 Member Function Documentation

- 6.620.3.1    `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal`  
           ( const util::PrimitiveMap \* *map*, std::vector< unsigned char > & *buffer* ) throw  
           ( decaf::lang::Exception ) [static]

Marshal a primitive map object to the given byte buffer.

### Parameters

<i>map</i>	Map to Marshal.
<i>buffer</i>	The byte buffer to write the marshaled data to.

### Exceptions

<i>Exception</i>	if an error occurs during the marshaling process.
------------------	---

- 6.620.3.2    `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal`  
           ( const util::PrimitiveList \* *list*, std::vector< unsigned char > & *buffer* ) throw (   
           decaf::lang::Exception ) [static]

Marshal a primitive list object to the given byte buffer.

### Parameters

<i>map</i>	The PrimitiveList to Marshal.
<i>buffer</i>	The byte buffer to write the marshaled data to.

### Exceptions

<i>Exception</i>	if an error occurs during the marshaling process.
------------------	---

**6.620.3.3** `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalList  
( const util::PrimitiveList * list, decaf::io::DataOutputStream & dataOut )  
throw ( decaf::lang::Exception ) [static]`

Marshal a PrimitiveList to the given DataOutputStream.

#### Parameters

<i>list</i>	The list object to Marshal
<i>dataOut</i>	Reference to a DataOutputStream to write the marshaled data to.

#### Exceptions

<i>Exception</i>	if an error occurs during the marshaling process.
------------------	---

**6.620.3.4** `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalMap  
( const util::PrimitiveMap * map, decaf::io::DataOutputStream & dataOut  
) throw ( decaf::lang::Exception ) [static]`

Marshal a primitive map object to the given DataOutputStream.

#### Parameters

<i>map</i>	Map to Marshal.
<i>dataOut</i>	Reference to a DataOutputStream to write the marshaled data to.

#### Exceptions

<i>Exception</i>	if an error occurs during the marshaling process.
------------------	---

**6.620.3.5** `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive  
( decaf::io::DataOutputStream & dataOut, const util::PrimitiveValueNode  
& value ) throw ( decaf::io::IOException ) [static, protected]`

Used to Marshal the Primitive types out on the Wire.

#### Parameters

<i>dataOut</i>	- the DataOutputStream to write to
<i>value</i>	- the ValueNode to write.

#### Exceptions

<i>IOException</i>	
--------------------	--

**6.620.3.6** static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveList  
 ( decaf::io::DataOutputStream & *dataOut*, const decaf::util::List<  
 util::PrimitiveValueNode > & *list* ) throw ( decaf::io::IOException )  
 [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

#### Parameters

<i>dataOut</i>	- the DataOutputStream to write to
<i>list</i>	- the ValueNode to write.

#### Exceptions

<i>IOException</i>	
--------------------	--

**6.620.3.7** static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveMap  
 ( decaf::io::DataOutputStream & *dataOut*, const decaf::util::Map<  
 std::string, util::PrimitiveValueNode > & *map* ) throw ( decaf::io::IOException ) [static, protected]

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

#### Parameters

<i>dataOut</i>	- the DataOutputStream to write to
<i>map</i>	- the ValueNode to write.

#### Exceptions

<i>IOException</i>	
--------------------	--

**6.620.3.8** static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal  
 ( util::PrimitiveList \* *list*, const std::vector< unsigned char > & *buffer* ) throw ( decaf::lang::Exception ) [static]

Unmarshal a PrimitiveList from the provided byte buffer.

#### Parameters

<i>map</i>	The List to populate with values from the marshaled data.
<i>buffer</i>	The byte buffer containing the marshaled Map.

#### Exceptions

<i>Exception</i>	if an error occurs during the unmarshal process.
------------------	--

**6.620.3.9** `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal  
( util::PrimitiveMap * map, const std::vector< unsigned char > & buffer ) throw  
( decaf::lang::Exception ) [static]`

Unmarshal a PrimitiveMap from the provided Byte buffer.

#### Parameters

<i>map</i>	The Map to populate with values from the marshaled data.
<i>buffer</i>	The byte buffer containing the marshaled Map.

#### Exceptions

<i>Exception</i>	if an error occurs during the unmarshal process.
------------------	--

**6.620.3.10** `static util::PrimitiveList* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalList  
( decaf::io::DataInputStream & dataIn ) throw ( decaf::lang::Exception )  
[static]`

Unmarshal a PrimitiveList from the given DataInputStream.

#### Parameters

<i>dataIn</i>	The DataInputStream instance to read the marshaled PrimitiveList from.
---------------	--

#### Returns

a pointer to a newly allocated PrimitiveList instnace.

#### Exceptions

<i>Exception</i>	if an error occurs during the unmarshal process.
------------------	--

**6.620.3.11** `static util::PrimitiveMap* ac-  
tivismq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalMap ( decaf::io::DataInputStream & dataIn ) throw ( decaf::lang::Exception )  
[static]`

Unmarshal a PrimitiveMap from the provided DataInputStream.

#### Parameters

<i>dataIn</i>	The DataInputStream instance to read the marshaled PrimitiveMap from.
---------------	---

#### Returns

a pointer to a newly allocated PrimitiveMap instnace.

## Exceptions

<i>Exception</i>	if an error occurs during the unmarshal process.
------------------	--

**6.620.3.12** static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive ( decaf::io::DataInputStream & *dataIn* ) throw ( decaf::io::IOException )  
 [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

## Parameters

<i>dataIn</i>	- DataInputStream to read from.
---------------	---------------------------------

## Returns

a PrimitiveValueNode containing the data.

## Exceptions

<i>IOException</i>	
--------------------	--

**6.620.3.13** static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveList ( decaf::io::DataInputStream & *dataIn*, decaf::util::StlList< util::PrimitiveValueNode > & *list* ) throw ( decaf::io::IOException )  
 [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

## Parameters

<i>dataIn</i>	- DataInputStream to read from.
<i>list</i>	- the ValueNode to write.

## Exceptions

<i>IOException</i>	
--------------------	--

**6.620.3.14** static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveMap ( decaf::io::DataInputStream & *dataIn*, util::PrimitiveMap & *map* ) throw ( decaf::io::IOException ) [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

**Parameters**

<i>dataIn</i>	- DataInputStream to read from.
<i>map</i>	- the map to fill with data.

**Exceptions**

<i>IOException</i>
--------------------

## 6.621 activemq::util::PrimitiveValueNode::PrimitiveValue Union Reference

Define a union type comprised of the various types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

**Data Fields**

- bool **boolValue**
- unsigned char **byteValue**
- char **charValue**
- short **shortValue**
- int **intValue**
- long long **longValue**
- double **doubleValue**
- float **floatValue**
- std::string \* **stringValue**
- std::vector< unsigned char > \* **byteArrayValue**
- decaf::util::List< **PrimitiveValueNode** > \* **listValue**
- decaf::util::Map< std::string, **PrimitiveValueNode** > \* **mapValue**

### 6.621.1 Detailed Description

Define a union type comprised of the various types.

### 6.621.2 Field Documentation

- 6.621.2.1 `bool activemq::util::PrimitiveValueNode::PrimitiveValue::boolValue`
- 6.621.2.2 `std::vector<unsigned char>* activemq::util::PrimitiveValueNode::PrimitiveValue::byteArrayValue`
- 6.621.2.3 `unsigned char activemq::util::PrimitiveValueNode::PrimitiveValue::byteValue`
- 6.621.2.4 `char activemq::util::PrimitiveValueNode::PrimitiveValue::charValue`
- 6.621.2.5 `double activemq::util::PrimitiveValueNode::PrimitiveValue::doubleValue`
- 6.621.2.6 `float activemq::util::PrimitiveValueNode::PrimitiveValue::floatValue`
- 6.621.2.7 `int activemq::util::PrimitiveValueNode::PrimitiveValue::intValue`
- 6.621.2.8 `decaf::util::List<PrimitiveValueNode>* activemq::util::PrimitiveValueNode::PrimitiveValue::listValue`
- 6.621.2.9 `long long activemq::util::PrimitiveValueNode::PrimitiveValue::longValue`
- 6.621.2.10 `decaf::util::Map<std::string, PrimitiveValueNode>* activemq::util::PrimitiveValueNode::PrimitiveValue::mapValue`
- 6.621.2.11 `short activemq::util::PrimitiveValueNode::PrimitiveValue::shortValue`
- 6.621.2.12 `std::string* activemq::util::PrimitiveValueNode::PrimitiveValue::stringValue`

The documentation for this union was generated from the following file:

- `src/main/activemq/util/PrimitiveValueNode.h`

## 6.622 activemq::util::PrimitiveValueConverter Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 3099) from one type to another.

```
#include <src/main/activemq/util/PrimitiveValueConverter.h>
```

### Public Member Functions

- **PrimitiveValueConverter** ()
- virtual **~PrimitiveValueConverter** ()
- template<typename TO >  
TO **convert** (const **PrimitiveValueNode** &value) const throw ( decaf::lang::exceptions::UnsupportedOperationException )

### 6.622.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 3099) from one type to another. If the conversion is supported then calling the convert method will throw an `UnsupportedOperationException` to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

	boolean	byte	short	int	long	float	double	String	
boolean	X	X							
byte	X	X	X	X	X				
short	X	X	X	X	X				
int	X	X	X	X	X				
long	X								
float	X	X	X			X	X		
double	X	X				X	X		
String						X	X	X	X

Since

3.0

### 6.622.2 Constructor & Destructor Documentation

6.622.2.1 `activemq::util::PrimitiveValueConverter::PrimitiveValueConverter ( )` [inline]

6.622.2.2 `virtual activemq::util::PrimitiveValueConverter::~~PrimitiveValueConverter ( )`  
[inline, virtual]

### 6.622.3 Member Function Documentation

6.622.3.1 `std::vector< unsigned char > activemq::util::PrimitiveValueConverter::convert ( const PrimitiveValueNode & value ) const throw ( decaf::lang::exceptions::UnsupportedOperationException )`  
[inline]

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveValueConverter.h`

## 6.623 activemq::util::PrimitiveValueNode Class Reference

Class that wraps around a single value of one of the many types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

### Data Structures

- union **PrimitiveValue**

*Define a union type comprised of the various types.*

- **PrimitiveType getType** () const  
*Gets the Value Type of this type wrapper.*
- **PrimitiveValue getValue** () const  
*Gets the internal Primitive Value object from this wrapper.*
- **void setValue** (const **PrimitiveValue** &value, **PrimitiveType** valueType)  
*Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.*
- **void clear** ()  
*Clears the value from this wrapper converting it back to a blank NULL\_TYPE value.*
- **void setBool** (bool value)  
*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*
- **bool getBool** () const throw ( decaf::lang::exceptions::NoSuchElementException )  
*Gets the Boolean value of this Node.*
- **void setByte** (unsigned char value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- unsigned char **getByte** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Byte value of this Node.*

- void **setChar** (char value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- char **getChar** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Character value of this Node.*

- void **setShort** (short value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- short **getShort** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Short value of this Node.*

- void **setInt** (int value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- int **getInt** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Integer value of this Node.*

- void **setLong** (long long value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- long long **getLong** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Long value of this Node.*

- void **setFloat** (float value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- float **getFloat** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Float value of this Node.*

- void **setDouble** (double value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- double **getDouble** () const throw (decaf::lang::exceptions::NoSuchElementException )

*Gets the Double value of this Node.*

- void **setString** (const std::string &value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- std::string **getString** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the String value of this Node.*

- void **setByteArray** (const std::vector< unsigned char > &value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- std::vector< unsigned char > **getByteArray** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Byte Array value of this Node.*

- void **setList** (const decaf::util::List< PrimitiveValueNode > &value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- const decaf::util::List< PrimitiveValueNode > & **getList** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Primitive List value of this Node.*

- void **setMap** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)

*Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.*

- const decaf::util::Map< std::string, PrimitiveValueNode > & **getMap** () const throw ( decaf::lang::exceptions::NoSuchElementException )

*Gets the Primitive Map value of this Node.*

- std::string **toString** () const

*Creates a string representation of this value.*

### 6.623.1 Detailed Description

Class that wraps around a single value of one of the many types. Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual

table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

### 6.623.2 Member Enumeration Documentation

#### 6.623.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

##### Enumerator:

*NULL\_TYPE*  
*BOOLEAN\_TYPE*  
*BYTE\_TYPE*  
*CHAR\_TYPE*  
*SHORT\_TYPE*  
*INTEGER\_TYPE*  
*LONG\_TYPE*  
*DOUBLE\_TYPE*  
*FLOAT\_TYPE*  
*STRING\_TYPE*  
*BYTE\_ARRAY\_TYPE*  
*MAP\_TYPE*  
*LIST\_TYPE*  
*BIG\_STRING\_TYPE*

### 6.623.3 Constructor & Destructor Documentation

#### 6.623.3.1 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( )

Default Constructor, creates a value of the *NULL\_TYPE*.

#### 6.623.3.2 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( bool *value* )

Boolean Value Constructor.

##### Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.3    `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( unsigned char value )`**

Byte Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.4    `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( char value )`**

Char Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.5    `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( short value )`**

Short Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.6    `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( int value )`**

Int Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.7    `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( long long value )`**

Long Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.8    `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( float value )`**

Float Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( double *value* )**

Double Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( const char \* *value* )**

String Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.11 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( const std::string & *value* )**

String Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.12 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( const std::vector< unsigned char > & *value* )**

Byte Array Value Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.13 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( const decaf::util::List< PrimitiveValueNode > & *value* )**

Primitive List Constructor.

**Parameters**

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.14** `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( const decaf::util::Map< std::string, PrimitiveValueNode > & value )`

Primitive Map Value Constructor.

#### Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

**6.623.3.15** `activemq::util::PrimitiveValueNode::PrimitiveValueNode ( const PrimitiveValueNode & node )`

Copy constructor.

#### Parameters

<i>node</i>	The instance of another node to copy to this one.
-------------	---

**6.623.3.16** `activemq::util::PrimitiveValueNode::~~PrimitiveValueNode ( ) [inline]`

### 6.623.4 Member Function Documentation

**6.623.4.1** `void activemq::util::PrimitiveValueNode::clear ( )`

Clears the value from this wrapper converting it back to a blank NULL\_TYPE value.

**6.623.4.2** `bool activemq::util::PrimitiveValueNode::getBool ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Boolean value of this Node.

#### Returns

value contained at the given index

#### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.3** `unsigned char activemq::util::PrimitiveValueNode::getByte ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Byte value of this Node.

**Returns**

value contained at the given index

**Exceptions**

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.4** `std::vector<unsigned char> activemq::util::PrimitiveValueNode::getByteArray ( )  
const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Byte Array value of this Node.

**Returns**

value contained at the given index

**Exceptions**

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.5** `char activemq::util::PrimitiveValueNode::getChar ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Character value of this Node.

**Returns**

value contained at the given index

**Exceptions**

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.6** `double activemq::util::PrimitiveValueNode::getDouble ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Double value of this Node.

**Returns**

value contained at the given index

**Exceptions**

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

#### 6.623.4.7 `float activemq::util::PrimitiveValueNode::getFloat ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Float value of this Node.

##### Returns

value contained at the given index

##### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

#### 6.623.4.8 `int activemq::util::PrimitiveValueNode::getInt ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Integer value of this Node.

##### Returns

value contained at the given index

##### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

#### 6.623.4.9 `const decaf::util::List<PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getList ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Primitive List value of this Node.

##### Returns

value contained at the given index

##### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.10** `long long activemq::util::PrimitiveValueNode::getLong ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Long value of this Node.

#### Returns

value contained at the given index

#### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.11** `const decaf::util::Map<std::string, PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getMap ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Primitive Map value of this Node.

#### Returns

value contained at the given index

#### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.12** `short activemq::util::PrimitiveValueNode::getShort ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the Short value of this Node.

#### Returns

value contained at the given index

#### Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.13** `std::string activemq::util::PrimitiveValueNode::getString ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )`

Gets the String value of this Node.

**Returns**

value contained at the given index

**Exceptions**

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

**6.623.4.14 PrimitiveType** activemq::util::PrimitiveValueNode::getType ( ) const  
[inline]

Gets the Value Type of this type wrapper.

**Returns**

the PrimitiveType value for this wrapper.

**6.623.4.15 PrimitiveValue** activemq::util::PrimitiveValueNode::getValue ( ) const  
[inline]

Gets the internal Primitive Value object from this wrapper.

**Returns**

a copy of the contained **PrimitiveValue** (p. 3097)

**6.623.4.16 PrimitiveValueNode&** activemq::util::PrimitiveValueNode::operator= ( const  
**PrimitiveValueNode & node** )

Assignment operator, copies the data from the other node.

**Parameters**

<i>node</i>	The instance of another node to copy to this one.
-------------	---

**6.623.4.17 bool** activemq::util::PrimitiveValueNode::operator== ( const **PrimitiveValueNode**  
& *node* ) const

Comparison Operator, compares this node to the other node.

**Returns**

true if the values are the same false otherwise.

**6.623.4.18 void activemq::util::PrimitiveValueNode::setBool ( bool *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.19 void activemq::util::PrimitiveValueNode::setByte ( unsigned char *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.20 void activemq::util::PrimitiveValueNode::setByteArray ( const std::vector< unsigned char > & *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.21 void activemq::util::PrimitiveValueNode::setChar ( char *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.22 void activemq::util::PrimitiveValueNode::setDouble ( double *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.23 void activemq::util::PrimitiveValueNode::setFloat ( float *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.24 void activemq::util::PrimitiveValueNode::setInt ( int *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.25 void activemq::util::PrimitiveValueNode::setList ( const decaf::util::List< PrimitiveValueNode > & *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.26 void activemq::util::PrimitiveValueNode::setLong ( long long *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.27 void activemq::util::PrimitiveValueNode::setMap ( const decaf::util::Map< std::string, PrimitiveValueNode > & *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.28 void activemq::util::PrimitiveValueNode::setShort ( short *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.29 void activemq::util::PrimitiveValueNode::setString ( const std::string & *value* )**

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

**Parameters**

<i>value</i>	- the new value to assign to the element at index
--------------	---

**6.623.4.30 void activemq::util::PrimitiveValueNode::setValue ( const PrimitiveValue & *value*, PrimitiveType *valueType* )**

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

**Parameters**

<i>value</i>	The value to set as the value contained in this Node.
<i>valueType</i>	The type of the value being set into this one.

**6.623.4.31 std::string activemq::util::PrimitiveValueNode::toString ( ) const**

Creates a string representation of this value.

**Returns**

string value of this type wrapper.

#### 6.624.3 Member Function Documentation

6.624.3.1 virtual bool `decaf::security::Principal::equals ( const Principal & another )` const  
[`pure virtual`]

Compares two principals to see if they are the same.

##### Parameters

<i>another</i>	A principal to be tested for equality to this one.
----------------	--

##### Returns

true if the given principal is equivalent to this one.

6.624.3.2 virtual std::string `decaf::security::Principal::getName ()` const [`pure virtual`]

Provides the name of this principal.

##### Returns

the name of this principal.

Implemented in `decaf::security::auth::x500::X500Principal` (p. 4140).

## Friends

- class **PriorityQueueIterator**

### 6.625.1 Detailed Description

`template<typename E> class decaf::util::PriorityQueue< E >`

An unbounded priority queue based on a binary heap algorithm. The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 1251) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an internal capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 1216) and **Iterator** (p. 2222) interfaces. The **Iterator** (p. 2222) provided in method **iterator()** (p. 3121) is not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort ( pq.toArray() )`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 3116) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe `PriorityBlockingQueue` class.

Implementation note: this implementation provides  $O(\log(n))$  time for the enqueueing and dequeuing methods (offer, poll, **remove()** (p. 3123) and add); linear time for the `remove(Object)` and `contains(Object)` methods; and constant time for the retrieval methods (peek, element, and size).

Since

1.0

### 6.625.2 Constructor & Destructor Documentation

**6.625.2.1** `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ( ) [inline]`

Creates a Priority **Queue** (p. 3239) with the default initial capacity.

**6.625.2.2** `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ( std::size_t initialCapacity ) [inline]`

Creates a Priority **Queue** (p. 3239) with the capacity value supplied.

**Parameters**

<i>initialCapacity</i>	The initial number of elements allocated to this <b>PriorityQueue</b> (p. 3116).
------------------------	--

**6.625.2.3** `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ( std::size_t initialCapacity, Comparator< E > * comparator ) [inline]`

Creates a **Priority Queue** (p. 3239) with the default initial capacity.

This new **PriorityQueue** (p. 3116) takes ownership of the passed **Comparator** (p. 1251) instance and uses that to determine the ordering of the elements in the **Queue** (p. 3239).

**Parameters**

<i>initialCapacity</i>	The initial number of elements allocated to this <b>PriorityQueue</b> (p. 3116).
<i>comparator</i>	The <b>Comparator</b> (p. 1251) instance to use in sorting the elements in the <b>Queue</b> (p. 3239).

**Exceptions**

<i>NullPointerException</i>	if the passed <b>Comparator</b> (p. 1251) is NULL.
-----------------------------	--

**6.625.2.4** `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ( const Collection< E > & source ) [inline]`

Creates a **PriorityQueue** (p. 3116) containing the elements in the specified **Collection** (p. 1216).

**Parameters**

<i>source</i>	the <b>Collection</b> (p. 1216) whose elements are to be placed into this priority queue
---------------	--

**6.625.2.5** `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ( const PriorityQueue< E > & source ) [inline]`

Creates a **PriorityQueue** (p. 3116) containing the elements in the specified priority queue.

This priority queue will be ordered according to the same ordering as the given priority queue.

**Parameters**

<i>source</i>	the priority queue whose elements are to be placed into this priority queue
---------------	---

6.625.2.6 `template<typename E> virtual decaf::util::PriorityQueue< E  
>::~~PriorityQueue( ) [inline, virtual]`

### 6.625.3 Member Function Documentation

6.625.3.1 `template<typename E> virtual bool decaf::util::PriorityQueue<  
E >::add ( const E & value ) throw (  
lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException,  
lang::exceptions::IllegalStateException) [inline, virtual]`

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an `IllegalStateException` if no space is currently available.

This implementation returns true if offer succeeds, else throws an `IllegalStateException`.

#### Parameters

<i>value</i>	- the element to offer to the <b>Queue</b> (p. 3239).
--------------	---

#### Returns

true if the add succeeds.

#### Exceptions

<i>IllegalArgumentException</i>	if the element cannot be added.
---------------------------------	---------------------------------

Reimplemented from `decaf::util::AbstractQueue< E >` (p. 177).

References `DECAF_CATCH_EXCEPTION_CONVERT`, `DECAF_CATCH_RETHROW`, `DECAF_CATCHALL_THROW`, and `decaf::util::PriorityQueue< E >::offer()`.

6.625.3.2 `template<typename E> virtual void decaf::util::PriorityQueue< E >::clear  
( ) throw ( lang::exceptions::UnsupportedOperationException )  
[inline, virtual]`

Removes all elements of the queue.

This implementation repeatedly invokes `poll` until it returns the empty marker.

Reimplemented from `decaf::util::AbstractQueue< E >` (p. 178).

6.625.3.3 `template<typename E> decaf::lang::Pointer< Comparator<E> >  
decaf::util::PriorityQueue< E >::comparator ( ) const [inline]`

obtains a Copy of the `Pointer` instance that this **PriorityQueue** (p. 3116) is using to compare the elements in the queue with.

The returned value is a copy, the caller cannot change the value if the internal Pointer value.

### Returns

a copy of the **Comparator** (p. 1251) Pointer being used by this **Queue** (p. 3239).

```
6.625.3.4  template<typename E> virtual decaf::util::Iterator<E>*
           decaf::util::PriorityQueue< E >::iterator ( ) const  [inline,
           virtual]
```

Implements **decaf::lang::Iterable**< E > (p. 2222).

```
6.625.3.5  template<typename E> virtual decaf::util::Iterator<E>*
           decaf::util::PriorityQueue< E >::iterator ( ) [inline, virtual]
```

### Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable**< E > (p. 2221).

References decaf::util::PriorityQueue< E >::PriorityQueueIterator.

```
6.625.3.6  template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (
           const E & value ) throw ( decaf::lang::exceptions::NullPointerException,
           decaf::lang::exceptions::IllegalArgumentException ) [inline,
           virtual]
```

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

### Parameters

<i>value</i>	the specified element to insert into the queue.
--------------	---

### Returns

true if the operation succeeds and false if it fails.

### Exceptions

<i>NullPointerException</i>	if the <b>Queue</b> (p. 3239) implementation does not allow Null values to be inserted into the <b>Queue</b> (p. 3239).
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue**< E > (p. 3241).

Referenced by **decaf::util::PriorityQueue**< E >::add().

**6.625.3.7** `template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue<E>::operator=( const PriorityQueue< E > & source ) [inline]`

Assignment operator, assign another **PriorityQueue** (p. 3116) to this one.

#### Parameters

<i>source</i>	The <b>PriorityQueue</b> (p. 3116) to copy to this one.
---------------	---

**6.625.3.8** `template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue<E>::operator=( const Collection< E > & source ) [inline]`

Assignment operator, assign another **Collection** (p. 1216) to this one.

#### Parameters

<i>source</i>	The <b>Collection</b> (p. 1216) to copy to this one.
---------------	--

**6.625.3.9** `template<typename E> virtual bool decaf::util::PriorityQueue< E >::peek ( E & result ) const [inline, virtual]`

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

#### Parameters

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

#### Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue**< E > (p. 3242).

**6.625.3.10** `template<typename E> virtual bool decaf::util::PriorityQueue< E >::poll ( E & result ) [inline, virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 3239) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

**Parameters**

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

**Returns**

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 3242).

**6.625.3.11** `template<typename E> virtual E decaf::util::PriorityQueue< E >::remove  
( ) throw ( decaf::lang::exceptions::NoSuchElementException )  
[inline, virtual]`

Retrieves and removes the head of this queue.

This method differs from poll only in that it throws an exception if this queue is empty.

This implementation returns the result of poll unless the queue is empty.

**Returns**

a copy of the element in the head of the queue.

**Exceptions**

<i>NoSuchElementException</i>	if the queue is empty.
-------------------------------	------------------------

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 179).

**6.625.3.12** `template<typename E> virtual bool decaf::util::PriorityQueue<  
E >::remove ( const E & value ) throw (  
lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException ) [inline,  
virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method

and this collection contains the specified object.

#### Parameters

<i>value</i>	- element to be removed from this collection, if present
--------------	--

#### Returns

true if an element was removed as a result of this call

#### Exceptions

<i>UnsupportedOperationException</i>	if the remove operation is not supported by this collection.
<i>IllegalArgumentException</i>	If the value is not a valid entry for this <b>Collection</b> (p. 1216).

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 168).

**6.625.3.13** `template<typename E> virtual std::size_t decaf::util::PriorityQueue< E  
>::size ( ) const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX\_VALUE elements, returns Integer.MAX\_VALUE.

#### Returns

the number of elements in this collection

Implements **decaf::util::Collection**< **E** > (p. 1226).

### 6.625.4 Friends And Related Function Documentation

**6.625.4.1** `template<typename E> friend class PriorityQueueIterator [friend]`

Referenced by `decaf::util::PriorityQueue< E >::iterator()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/ProducerAck.h`

## 6.626 activemq::commands::ProducerAck Class Reference

```
#include <src/main/activemq/commands/ProducerAck.h>
```

Inheritance diagram for `activemq::commands::ProducerAck`:

## Public Member Functions

- **ProducerAck ()**
- virtual **~ProducerAck ()**
- virtual unsigned char **getDataStructureType ()** const  
*Get the unique identifier that this object and its own Marshaler share.*
- virtual **ProducerAck \* cloneDataStructure ()** const  
*Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.*
- virtual void **copyDataStructure (const DataStructure \*src)**  
*Copy the contents of the passed object into this object's members, overwriting any existing data.*
- virtual std::string **toString ()** const  
*Returns a string containing the information for this DataStructure (p. 1713) such as its type and value of its elements.*
- virtual bool **equals (const DataStructure \*value)** const  
*Compares the DataStructure (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer< ProducerId > & getProducerId ()** const
- virtual **Pointer< ProducerId > & getProducerId ()**
- virtual void **setProducerId (const Pointer< ProducerId > &producerId)**
- virtual int **getSize ()** const
- virtual void **setSize (int size)**
- virtual bool **isProducerAck ()** const
- virtual **Pointer< Command > visit (activemq::state::CommandVisitor \*visitor)**  
 throw ( exceptions::ActiveMQException )  
*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

## Static Public Attributes

- static const unsigned char **ID\_PRODUCERACK = 19**

## Protected Attributes

- **Pointer< ProducerId > producerId**
- **int size**

### 6.626.1 Constructor & Destructor Documentation

6.626.1.1 `activemq::commands::ProducerAck::ProducerAck ( )`

6.626.1.2 `virtual activemq::commands::ProducerAck::~~ProducerAck ( ) [virtual]`

### 6.626.2 Member Function Documentation

6.626.2.1 `virtual ProducerAck* activemq::commands::ProducerAck::cloneDataStructure ( ) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

#### Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.626.2.2 `virtual void activemq::commands::ProducerAck::copyDataStructure ( const DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

#### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.626.2.3 `virtual bool activemq::commands::ProducerAck::equals ( const DataStructure * value ) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

**6.626.2.4** `virtual unsigned char activemq::commands::ProducerAck::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSetructure** (p. 1713) type copy.

Implements **activemq::commands::DataSetructure** (p. 1717).

**6.626.2.5** `virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId ( ) const [virtual]`

**6.626.2.6** `virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId ( ) [virtual]`

**6.626.2.7** `virtual int activemq::commands::ProducerAck::getSize ( ) const [virtual]`

**6.626.2.8** `virtual bool activemq::commands::ProducerAck::isProducerAck ( ) const [inline, virtual]`

#### Returns

an answer of true to the **isProducerAck()** (p. 3127) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 769).

**6.626.2.9** `virtual void activemq::commands::ProducerAck::setProducerId ( const Pointer<ProducerId> & producerId ) [virtual]`

**6.626.2.10** `virtual void activemq::commands::ProducerAck::setSize ( int size ) [virtual]`

**6.626.2.11** `virtual std::string activemq::commands::ProducerAck::toString ( ) const [virtual]`

Returns a string containing the information for this **DataSetructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

## 6.627 activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller Class Reference 3131

---

**6.626.2.12** `virtual Pointer<Command> activemq::commands::ProducerAck::visit  
( activemq::state::CommandVisitor * visitor ) throw (  
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.626.3 Field Documentation

**6.626.3.1** `const unsigned char activemq::commands::ProducerAck::ID_-  
PRODUCERACK = 19 [static]`

**6.626.3.2** `Pointer<ProducerId> activemq::commands::ProducerAck::producerId  
[protected]`

**6.626.3.3** `int activemq::commands::ProducerAck::size [protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ProducerAck.h`

## 6.627 activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3128).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ProducerAckMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller`:

### Public Member Functions

*Write a object instance to data output stream.*

### 6.627.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3128). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.627.2 Constructor & Destructor Documentation

- 6.627.2.1 `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::ProducerAckMarshaller ( ) [inline]`
- 6.627.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::~~ProducerAckMarshaller ( ) [inline, virtual]`

## 6.627.3 Member Function Documentation

- 6.627.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

- 6.627.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

- 6.627.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

**6.627.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

**6.627.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

**6.627.3.6** `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

**6.627.3.7** `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ProducerAckMarshaller.h`

## 6.628 `activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller` Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3133).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ProducerAckMarshaller.h>
```

### 6.628.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3133). NOTE!  
This file is auto generated - do not modify! if you need to make a change, please see  
the Java Classes in the activemq-openwire-generator module

### 6.628.2 Constructor & Destructor Documentation

**6.628.2.1** `activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::ProducerAckMarshaller  
( ) [inline]`

**6.628.2.2** `virtual activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::~~ProducerAckMarshaller  
( ) [inline, virtual]`

### 6.628.3 Member Function Documentation

**6.628.3.1** `virtual commands::DataStructure* ac-  
tivemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::createObject ( )  
const [virtual]`

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

**6.628.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::getDataStructureType  
( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.628.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseMarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (  
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 780).

**6.628.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 781).

**6.628.3.5** `virtual int activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

**6.628.3.6** virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal2  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure  
 \* *dataStructure*, decaf::io::DataOutputStream \* *dataOut*,  
 utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException )  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

**6.628.3.7** virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightUnmarshal  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream  
 \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i> if an error occurs during the unmarshal.
---

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

( ) [inline, virtual]

### 6.629.3 Member Function Documentation

**6.629.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.629.3.2** **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.629.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 772).

**6.629.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 774).

6.629.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

6.629.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

```
6.629.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

### 6.630.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3141). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.630.2 Constructor & Destructor Documentation

**6.630.2.1** **activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::ProducerAckMarshaller**  
( ) [inline]

**6.630.2.2** **virtual activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::~~ProducerAckMarshaller**  
( ) [inline, virtual]

### 6.630.3 Member Function Documentation

**6.630.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.630.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.630.3.3** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

**6.630.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

**6.630.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

**6.630.3.6** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 797).

**6.630.3.7** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/ProducerAckMarshaller.h`

## 6.631 **activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller** Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3145).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/ProducerAckMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller**:

### 6.631.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3145). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.631.2 Constructor & Destructor Documentation

6.631.2.1 `activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::ProducerAckMarshaller ( ) [inline]`

6.631.2.2 `virtual activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::~~ProducerAckMarshaller ( ) [inline, virtual]`

## 6.631.3 Member Function Documentation

6.631.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.631.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.631.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

**6.631.3.4** `virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

**6.631.3.5** `virtual int activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.631.3.6  virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.631.3.7  virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 806).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/ProducerAckMarshaller.h

## 6.632 activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3150).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/ProducerAckMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller:

### 6.632.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 3150). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.632.2 Constructor & Destructor Documentation

6.632.2.1 **activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::ProducerAckMarshaller**  
( ) [inline]

6.632.2.2 **virtual activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::~~ProducerAckMarshaller**  
( ) [inline, virtual]

### 6.632.3 Member Function Documentation

6.632.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.632.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.632.3.3 **virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

**6.632.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

**6.632.3.5** `virtual int activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 789).

```
6.632.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790).

```
6.632.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ProducerAckMarshaller.h**

## 6.633 activemq::cmsutil::ProducerCallback Class Reference

Callback for sending a message to a CMS destination.

```
#include <src/main/activemq/cmsutil/ProducerCallback.h>
```

Inheritance diagram for activemq::cmsutil::ProducerCallback:

### Public Member Functions

- virtual **~ProducerCallback** ()
- virtual void **doInCms** (**cms::Session** \*session, **cms::MessageProducer** \*producer)=0  
throw ( cms::CMSException )  
*Execute an action given a session and producer.*

#### 6.633.1 Detailed Description

Callback for sending a message to a CMS destination.

#### 6.633.2 Constructor & Destructor Documentation

**6.633.2.1** virtual **activemq::cmsutil::ProducerCallback::~ProducerCallback** ( ) [inline, virtual]

#### 6.633.3 Member Function Documentation

**6.633.3.1** virtual void **activemq::cmsutil::ProducerCallback::doInCms** ( **cms::Session** \**session*, **cms::MessageProducer** \* *producer* ) throw ( cms::CMSException )  
[pure virtual]

Execute an action given a session and producer.

### Parameters

<i>session</i>	the CMS Session
<i>producer</i>	the CMS Producer

### Exceptions

<b><i>cms::CMSException</i></b> (p. 1190)	if thrown by CMS API methods
--	------------------------------

Implemented in **activemq::cmsutil::CmsTemplate::SendExecutor** (p. 3446).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/ProducerCallback.h`

## 6.634 activemq::cmsutil::CmsTemplate::ProducerExecutor Class Reference

```
#include <src/main/activemq/cmsutil/CmsTemplate.h>
```

Inheritance diagram for `activemq::cmsutil::CmsTemplate::ProducerExecutor`:

### Public Member Functions

- **ProducerExecutor** (**ProducerCallback** \*action, **CmsTemplate** \*parent, **cms::Destination** \*destination)
- virtual **~ProducerExecutor** ()
- virtual void **doInCms** (**cms::Session** \*session) throw ( **cms::CMSException** )  
*Execute any number of operations against the supplied CMS session.*
- virtual **cms::Destination** \* **getDestination** (**cms::Session** \*session **AMQCPP\_UNUSED**) throw ( **cms::CMSException** )

### Protected Member Functions

- **ProducerExecutor** & **operator=** (const **ProducerExecutor** &)

### Protected Attributes

- **ProducerCallback** \* action
- **CmsTemplate** \* parent
- **cms::Destination** \* destination

## 6.634 activemq::cmsutil::CmsTemplate::ProducerExecutor Class Reference 3159

### 6.634.1 Constructor & Destructor Documentation

6.634.1.1 `activemq::cmsutil::CmsTemplate::ProducerExecutor::ProducerExecutor ( const ProducerExecutor & ) [inline, protected]`

6.634.1.2 `activemq::cmsutil::CmsTemplate::ProducerExecutor::ProducerExecutor ( ProducerCallback * action, CmsTemplate * parent, cms::Destination * destination ) [inline]`

6.634.1.3 `virtual activemq::cmsutil::CmsTemplate::ProducerExecutor::~~ProducerExecutor ( ) [inline, virtual]`

### 6.634.2 Member Function Documentation

6.634.2.1 `virtual void activemq::cmsutil::CmsTemplate::ProducerExecutor::doInCms ( cms::Session * session ) throw ( cms::CMSEException ) [virtual]`

Execute any number of operations against the supplied CMS session.

#### Parameters

<i>session</i>	the CMS Session
----------------	-----------------

#### Exceptions

<i>cms::CMSEException</i> (p. 1190)	if thrown by CMS API methods
--	------------------------------

Implements `activemq::cmsutil::SessionCallback` (p. 3476).

6.634.2.2 `virtual cms::Destination* activemq::cmsutil::CmsTemplate::ProducerExecutor::getDestination ( cms::Session *session AMQCPP_UNUSED ) throw ( cms::CMSEException ) [inline, virtual]`

6.634.2.3 `ProducerExecutor& activemq::cmsutil::CmsTemplate::ProducerExecutor::operator= ( const ProducerExecutor & ) [inline, protected]`

### 6.634.3 Field Documentation

6.634.3.1 `ProducerCallback* activemq::cmsutil::CmsTemplate::ProducerExecutor::action [protected]`

6.634.3.2 `cms::Destination* activemq::cmsutil::CmsTemplate::ProducerExecutor::destination [protected]`

## 6.635.1 Member Typedef Documentation

- 6.635.1.1 **typedef decaf::lang::PointerComparator<ProducerId>  
activemq::commands::ProducerId::COMPARATOR**

## 6.635.2 Constructor & Destructor Documentation

- 6.635.2.1 **activemq::commands::ProducerId::ProducerId ( )**
- 6.635.2.2 **activemq::commands::ProducerId::ProducerId ( const **ProducerId** & *other* )**
- 6.635.2.3 **activemq::commands::ProducerId::ProducerId ( const **SessionId** & *sessionId*, long long *consumerId* )**
- 6.635.2.4 **activemq::commands::ProducerId::ProducerId ( std::string *producerId* )**
- 6.635.2.5 **virtual activemq::commands::ProducerId::~~ProducerId ( ) [virtual]**

## 6.635.3 Member Function Documentation

- 6.635.3.1 **virtual **ProducerId**\* activemq::commands::ProducerId::cloneDataStructure ( )  
const [virtual]**

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

**Returns**

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

**6.635.3.2** `virtual int activemq::commands::ProducerId::compareTo ( const ProducerId & value ) const` [virtual]

**6.635.3.3** `virtual void activemq::commands::ProducerId::copyDataStructure ( const DataStructure * src )` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

**Parameters**

<i>src</i>	- Source Object
------------	-----------------

Implements **activemq::commands::DataStructure** (p. 1715).

**6.635.3.4** `virtual bool activemq::commands::ProducerId::equals ( const DataStructure * value ) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

**Returns**

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

**6.635.3.5** `virtual bool activemq::commands::ProducerId::equals ( const ProducerId & value ) const` [virtual]

**6.635.3.6** `virtual const std::string& activemq::commands::ProducerId::getConnectionId ( ) const` [virtual]

**6.635.3.7** `virtual std::string& activemq::commands::ProducerId::getConnectionId ( )` [virtual]

**6.635.3.8** `virtual unsigned char activemq::commands::ProducerId::getDataStructureType ( ) const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

**Returns**

new **DataSet** (p. 1713) type copy.

Implements **activemq::commands::DataSet** (p. 1717).

**6.635.3.9** `const Pointer<SessionId>& activemq::commands::ProducerId::getParentId ( ) const`

**6.635.3.10** `virtual long long activemq::commands::ProducerId::getSessionId ( ) const [virtual]`

**6.635.3.11** `virtual long long activemq::commands::ProducerId::getValue ( ) const [virtual]`

**6.635.3.12** `virtual bool activemq::commands::ProducerId::operator< ( const ProducerId & value ) const [virtual]`

**6.635.3.13** `ProducerId& activemq::commands::ProducerId::operator= ( const ProducerId & other )`

**6.635.3.14** `virtual bool activemq::commands::ProducerId::operator== ( const ProducerId & value ) const [virtual]`

**6.635.3.15** `virtual void activemq::commands::ProducerId::setConnectionId ( const std::string & connectionId ) [virtual]`

**6.635.3.16** `void activemq::commands::ProducerId::setProducerSessionKey ( std::string sessionKey )`

**6.635.3.17** `virtual void activemq::commands::ProducerId::setSessionId ( long long sessionId ) [virtual]`

**6.635.3.18** `virtual void activemq::commands::ProducerId::setValue ( long long value ) [virtual]`

**6.635.3.19** `virtual std::string activemq::commands::ProducerId::toString ( ) const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

**Returns**

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 841).

### 6.635.4 Field Documentation

6.635.4.1 `std::string activemq::commands::ProducerId::connectionId`  
[protected]

6.635.4.2 `const unsigned char activemq::commands::ProducerId::ID_-  
PRODUCERID = 123` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.635.4.3 `long long activemq::commands::ProducerId::sessionId` [protected]

6.635.4.4 `long long activemq::commands::ProducerId::value` [protected]

### 6.636.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 3161). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.636.2 Constructor & Destructor Documentation

- 6.636.2.1 **activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::ProducerIdMarshaller**  
( ) [inline]
- 6.636.2.2 **virtual activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::~~ProducerIdMarshaller**  
( ) [inline, virtual]

### 6.636.3 Member Function Documentation

- 6.636.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.636.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.636.3.3** `virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1675).

**6.636.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

## 6.636 activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller

### Class Reference 3167

---

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

```
6.636.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.636.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.636.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**ProducerIdMarshaller.h**

## 6.637 activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 3165).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ProducerIdMarsh
```

6.637.2.2 **virtual activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::~~ProducerIdMarshaller**  
( ) [inline, virtual]

### 6.637.3 Member Function Documentation

6.637.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.637.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.637.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.637.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.637.3.5** `virtual int activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

**6.637.3.6** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

**6.637.3.7** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

( ) [inline, virtual]

### 6.638.3 Member Function Documentation

6.638.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.638.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.638.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.638.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.638.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

**6.638.3.6** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

**6.638.3.7** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

### 6.639.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 3173). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.639.2 Constructor & Destructor Documentation

6.639.2.1 **activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::ProducerIdMarshaller**  
( ) [inline]

6.639.2.2 **virtual activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::~~ProducerIdMarshaller**  
( ) [inline, virtual]

### 6.639.3 Member Function Documentation

6.639.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.639.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.639.3.3** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.639.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.639.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

**6.639.3.6** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

**6.639.3.7** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/ProducerIdMarshaller.h`

### 6.640.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 3177). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.640.2 Constructor & Destructor Documentation

6.640.2.1 **activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::ProducerIdMarshaller**  
( ) [inline]

6.640.2.2 **virtual activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::~~ProducerIdMarshaller**  
( ) [inline, virtual]

### 6.640.3 Member Function Documentation

6.640.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.640.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.640.3.3** `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.640.3.4** `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.640.3.5** `virtual int activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

**6.640.3.6** `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

**6.640.3.7** `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

### 6.641.3 Member Function Documentation

6.641.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.641.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.641.3.3** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.641.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.641.3.5** `virtual int activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

**6.641.3.6** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

**6.641.3.7** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

### Static Public Attributes

- static const unsigned char **ID\_PRODUCERINFO** = 6

### Protected Attributes

- **Pointer< ProducerId > producerId**
- **Pointer< ActiveMQDestination > destination**
- std::vector< **decaf::lang::Pointer< BrokerId > > brokerPath**
- bool **dispatchAsync**
- int **windowSize**

## 6.642.1 Constructor & Destructor Documentation

6.642.1.1 `activemq::commands::ProducerInfo::ProducerInfo ( )`

6.642.1.2 `virtual activemq::commands::ProducerInfo::~~ProducerInfo ( ) [virtual]`

## 6.642.2 Member Function Documentation

6.642.2.1 `virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure ( ) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.642.2.2 `virtual void activemq::commands::ProducerInfo::copyDataStructure ( const DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.642.2.3 `Pointer<RemoveInfo> activemq::commands::ProducerInfo::createRemoveCommand ( ) const`

6.642.2.4 `virtual bool activemq::commands::ProducerInfo::equals ( const DataStructure * value ) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

### Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

- 6.642.2.5 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath ( ) const [virtual]`
- 6.642.2.6 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath ( ) [virtual]`
- 6.642.2.7 `virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSetructure** (p. 1713) type copy.

Implements **activemq::commands::DataSetructure** (p. 1717).

- 6.642.2.8 `virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination ( ) const [virtual]`
- 6.642.2.9 `virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination ( ) [virtual]`
- 6.642.2.10 `virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId ( ) [virtual]`
- 6.642.2.11 `virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId ( ) const [virtual]`
- 6.642.2.12 `virtual int activemq::commands::ProducerInfo::getWindowSize ( ) const [virtual]`
- 6.642.2.13 `virtual bool activemq::commands::ProducerInfo::isDispatchAsync ( ) const [virtual]`
- 6.642.2.14 `virtual bool activemq::commands::ProducerInfo::isProducerInfo ( ) const [inline, virtual]`

#### Returns

an answer of true to the **isProducerInfo()** (p. 3188) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 769).

- 6.642.2.15 `virtual void activemq::commands::ProducerInfo::setBrokerPath ( const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath ) [virtual]`
- 6.642.2.16 `virtual void activemq::commands::ProducerInfo::setDestination ( const Pointer< ActiveMQDestination > & destination ) [virtual]`
- 6.642.2.17 `virtual void activemq::commands::ProducerInfo::setDispatchAsync ( bool dispatchAsync ) [virtual]`
- 6.642.2.18 `virtual void activemq::commands::ProducerInfo::setProducerId ( const Pointer< ProducerId > & producerId ) [virtual]`
- 6.642.2.19 `virtual void activemq::commands::ProducerInfo::setWindowSize ( int windowSize ) [virtual]`
- 6.642.2.20 `virtual std::string activemq::commands::ProducerInfo::toString ( ) const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

- 6.642.2.21 `virtual Pointer<Command> activemq::commands::ProducerInfo::visit ( activemq::state::CommandVisitor * visitor ) throw ( exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.642.3 Field Documentation

### 6.643.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 3190). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.643.2 Constructor & Destructor Documentation

6.643.2.1 **activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::ProducerInfoMarshaller** ( ) [inline]

6.643.2.2 **virtual activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::~~ProducerInfoMarshaller** ( ) [inline, virtual]

### 6.643.3 Member Function Documentation

6.643.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::createObject** ( ) **const** [virtual]

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.643.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.643.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

**6.643.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```
6.643.3.5  virtual int activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

```
6.643.3.6  virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.644 activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller

### Class Reference

3197

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

**6.643.3.7** virtual void **activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**ProducerInfoMarshaller.h**

## 6.644.3 Member Function Documentation

6.644.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.644.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.644.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

**6.644.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

**6.644.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.644 activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller

### Class Reference 3201

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

```
6.644.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataOutputStream * dataOut,
 utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

```
6.644.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
 dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
 * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

### 6.645.3 Member Function Documentation

**6.645.3.1** `virtual commands::DataStructure* ac-  
 tivemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::createObject ( )  
 const [virtual]`

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.645.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::getDataStructureType  
 ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.645.3.3** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseMarshal  
 ( OpenWireFormat * wireFormat, commands::DataStructure  
 * dataStructure, decaf::io::DataOutputStream * dataOut ) throw (  
 decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

**6.645.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

**6.645.3.5** `virtual int activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

**6.645.3.6** virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal2  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure  
 \* *dataStructure*, decaf::io::DataOutputStream \* *dataOut*,  
 utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException )  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

**6.645.3.7** virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightUnmarshal  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream  
 \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i> if an error occurs during the unmarshal.

**6.646.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.646.3.2** **virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.646.3.3** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 794).

**6.646.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 795).

6.646.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

6.646.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

```
6.646.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

### 6.647.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 3207). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.647.2 Constructor & Destructor Documentation

**6.647.2.1** **activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::ProducerInfoMarshaller**  
( ) [inline]

**6.647.2.2** **virtual activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::~~ProducerInfoMarshaller**  
( ) [inline, virtual]

### 6.647.3 Member Function Documentation

**6.647.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.647.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.647.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

**6.647.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

**6.647.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 775).

**6.647.3.6** `virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 776).

```
6.647.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

### 6.648.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 3211). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.648.2 Constructor & Destructor Documentation

6.648.2.1 `activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::ProducerInfoMarshaller ( ) [inline]`

6.648.2.2 `virtual activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::~~ProducerInfoMarshaller ( ) [inline, virtual]`

## 6.648.3 Member Function Documentation

6.648.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.648.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.648.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

**6.648.3.4** `virtual void activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

**6.648.3.5** `virtual int activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.648.3.6 virtual void activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.648.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 806).

The documentation for this class was generated from the following file:

## Protected Attributes

- **decaf::lang::Pointer< Properties > defaults**  
*Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.*

### 6.650.1 Detailed Description

Java-like properties class for mapping string names to string values. The **Properties** (p. 3216) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 3216) instance can contain an internal **Properties** (p. 3216) list that contains default values for keys not found in the **Properties** (p. 3216) **List** (p. 2409).

The **Properties** (p. 3216) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

**Since**

1.0

**6.650.2 Constructor & Destructor Documentation****6.650.2.1** `decaf::util::Properties::Properties ( )`**6.650.2.2** `decaf::util::Properties::Properties ( const Properties & src )`**6.650.2.3** `virtual decaf::util::Properties::~~Properties ( )` `[virtual]`**6.650.3 Member Function Documentation****6.650.3.1** `void decaf::util::Properties::clear ( )`

Clears all properties from the map.

**6.650.3.2** `Properties* decaf::util::Properties::clone ( ) const`

Clones this object.

**Returns**

a replica of this object.

**6.650.3.3** `void decaf::util::Properties::copy ( const Properties & source )`Copies the contents of the given properties object to this one, if the given **Properties** (p. 3216) instance is NULL then this **List** (p. 2409) is not modified.**Parameters**

<i>source</i>	The source properties object.
---------------	-------------------------------

**6.650.3.4** `bool decaf::util::Properties::equals ( const Properties & source ) const`Test whether two **Properties** (p. 3216) objects are equivalent.Two **Properties** (p. 3216) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

**Parameters**

<i>source</i>	The <b>Properties</b> (p. 3216) object to compare this instance to.
---------------	---

**Returns**

true if the contents of the two **Properties** (p. 3216) objects are the same.

**6.650.3.5** `const char* decaf::util::Properties::getProperty ( const std::string & name ) const`

Looks up the value for the given property.

**Parameters**

<i>name</i>	The name of the property to be looked up.
-------------	---

**Returns**

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

**6.650.3.6** `std::string decaf::util::Properties::getProperty ( const std::string & name, const std::string & defaultValue ) const`

Looks up the value for the given property.

**Parameters**

<i>name</i>	The name of the property to be looked up.
<i>defaultValue</i>	The value to be returned if the given property does not exist.

**Returns**

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

**6.650.3.7** `bool decaf::util::Properties::hasProperty ( const std::string & name ) const`

Check to see if the Property exists in the set.

**Parameters**

<i>name</i>	The property name to check for in this properties set.
-------------	--

**Returns**

true if property exists, false otherwise.

**6.650.3.8** `bool decaf::util::Properties::isEmpty ( ) const`

Returns true if the properties object is empty.

**Returns**

true if empty

**6.650.3.9** void decaf::util::Properties::load ( decaf::io::InputStream  
\* *stream* ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::IllegalArgumentException,  
decaf::lang::exceptions::NullPointerException )

Reads a property list (key and element pairs) from the input byte stream.

The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

**Parameters**

<i>stream</i>	The stream to read the properties data from.
---------------	--

**Exceptions**

<i>IOException</i>	if there is an error while reading from the stream.
<i>IllegalArgumentException</i>	if malformed data is found while reading the properties.
<i>NullPointerException</i>	if the passed stream is Null.

**6.650.3.10** void decaf::util::Properties::load ( decaf::io::Reader  
\* *reader* ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::IllegalArgumentException,  
decaf::lang::exceptions::NullPointerException )

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

**Properties** (p. 3216) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character \. Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is

ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab (""), and form feed ("") to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no effect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of 2n contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

```
\:\=
```

would be the two-character key ":\=" . Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=' or ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

```
Truth = Beauty Truth:Beauty Truth :Beauty
```

As another example, the following three lines specify a single property:

```
fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango
```

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

```
cheeses
```

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those

used for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.
- The method does not treat a backslash character, `\`, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence `"\z"` would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence `"\b"` as equivalent to the single character `'b'`.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

#### Parameters

<i>reader</i>	The Reader that provides an character stream as input.
---------------	--

#### Exceptions

<i>IOException</i>	if there is an error while reading from the stream.
<i>IllegalArgumentException</i>	if malformed data is found while reading the properties.
<i>NullPointerException</i>	if the passed stream is Null.

#### 6.650.3.11 Properties& decaf::util::Properties::operator= ( const Properties & src )

Assignment Operator.

#### Parameters

<i>src</i>	The <b>Properties</b> (p. 3216) list to copy to this <b>List</b> (p. 2409).
------------	---

#### Returns

a reference to this **List** (p. 2409) for use in chaining.

#### 6.650.3.12 std::vector<std::string> decaf::util::Properties::propertyNames ( ) const

Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

**Returns**

a set of keys in this property list where the key and its corresponding value are strings, including the keys in the default property list.

**6.650.3.13** `std::string decaf::util::Properties::remove ( const std::string & name )`

Removes the property with the given name.

**Parameters**

<i>name</i>	The name of the property to remove.
-------------	-------------------------------------

**Returns**

the previous value of the property if set, or empty string.

**6.650.3.14** `std::string decaf::util::Properties::setProperty ( const std::string & name, const std::string & value )`

Sets the value for a given property.

If the property already exists, overwrites the value.

**Parameters**

<i>name</i>	The name of the value to be written.
<i>value</i>	The value to be written.

**Returns**

the old value of the property or empty string if not set.

**6.650.3.15** `std::size_t decaf::util::Properties::size ( ) const`**Returns**

The number of **Properties** (p. 3216) in this **Properties** (p. 3216) Object.

**6.650.3.16** `void decaf::util::Properties::store ( decaf::io::OutputStream * out, const std::string & comment ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException )`

Writes this property list (key and element pairs) in this **Properties** (p. 3216) table to the output stream in a format suitable for loading into a **Properties** (p. 3216) table using the load(InputStream) method.

**Properties** (p. 3216) from the defaults table of this **Properties** (p. 3216) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in `store(Writer)`, with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value `xxxx`.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value `xxxx`.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

#### Parameters

<i>out</i>	The <code>OutputStream</code> instance to write the properties to.
<i>comment</i>	A description of these properties that is written to the output stream.

#### Exceptions

<i>IOException</i>	if there is an error while writing from the stream.
<i>NullPointerException</i>	if the passed stream is <code>Null</code> .

**6.650.3.17** `void decaf::util::Properties::store ( decaf::io::Writer * writer,  
const std::string & comments ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::NullPointerException )`

Writes this property list (key and element pairs) in this **Properties** (p. 3216) table to the output character stream in a format that can be read by the `load(Reader)` method.

**Properties** (p. 3216) from the defaults table of this **Properties** (p. 3216) table (if any) are not written out by this method.

If the `comments` argument is not empty, then an ASCII `#` character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed (‘

’), a carriage return (‘’), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the `Writer` and if the next character in comments is not character `#` or character `!` then an ASCII `#` is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII `#` character, the current date and time (as if produced by the `toString` method of **Date** (p. 1719) for the current time), and a line separator as generated by the `Writer`.

Then every entry in this **Properties** (p. 3216) table is written out, one per line. For each entry the key string is written, then an ASCII `=`, then the associated element string. For the key, all space characters are written with a preceding `\` character. For the element, leading space characters, but not embedded or trailing space characters, are written

with a preceding `\` character. The key and element characters `#`, `!`, `=`, and `:` are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

### Parameters

<i>writer</i>	The Writer instance to use to output the properties.
<i>comments</i>	A description of these properties that is written before writing the properties.

### Exceptions

<i>IOException</i>	if there is an error while writing from the stream.
<i>NullPointerException</i>	if the passed stream is Null.

**6.650.3.18** `std::vector< std::pair< std::string, std::string > > decaf::util::Properties::toArray ( ) const`

Method that serializes the contents of the property map to an array.

### Returns

list of pairs where the first is the name and the second is the value.

**6.650.3.19** `std::string decaf::util::Properties::toString ( ) const`

Formats the contents of the **Properties** (p. 3216) Object into a string that can be logged, etc.

### Returns

string value of this object.

## 6.650.4 Field Documentation

**6.650.4.1** `decaf::lang::Pointer<Properties> decaf::util::Properties::defaults [protected]`

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Properties.h`

## 6.651 decaf::util::logging::PropertiesChangeListener Class Reference

Defines the interface that classes can use to listen for change events on **Properties** (p. 3216).

```
#include <src/main/decaf/util/logging/PropertiesChangeListener.h>
```

### Public Member Functions

- virtual `~PropertiesChangeListener ()`
- virtual void `onPropertiesReset ()=0`  
*Indicates that the **Properties** (p. 3216) have all been reset and should be considered to be back to their default values.*
- virtual void `onPropertyChanged (const std::string &name, const std::string &old-Value, const std::string &newValue)=0`  
*Change Event, called when a property is changed, includes the name of the property that was changed along with it old and new values.*

### 6.651.1 Detailed Description

Defines the interface that classes can use to listen for change events on **Properties** (p. 3216).

Since

1.0

### 6.651.2 Constructor & Destructor Documentation

6.651.2.1 virtual `decaf::util::logging::PropertiesChangeListener::~~PropertiesChangeListener ( )` [inline, virtual]

### 6.651.3 Member Function Documentation

6.651.3.1 virtual void `decaf::util::logging::PropertiesChangeListener::onPropertiesReset ( )` [pure virtual]

Indicates that the **Properties** (p. 3216) have all been reset and should be considered to be back to their default values.

6.651.3.2 virtual void decaf::util::logging::PropertiesChangeListener::onPropertyChanged ( const std::string & *name*, const std::string & *oldValue*, const std::string & *newValue* )  
[pure virtual]

Change Event, called when a property is changed, includes the name of the property that was changed along with it old and new values.

#### Parameters

<i>name</i>	The name of the Property that changed.
<i>oldValue</i>	The old Value of the Property.
<i>newValue</i>	The new Value of the Property.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**PropertiesChangeListener.h**

## 6.652 decaf::net::ProtocolException Class Reference

```
#include <src/main/decaf/net/ProtocolException.h>
```

Inheritance diagram for decaf::net::ProtocolException:

#### Public Member Functions

- **ProtocolException** () throw ()  
*Default Constructor.*
- **ProtocolException** (const Exception &ex) throw ()  
*Conversion Constructor from some other Exception.*
- **ProtocolException** (const **ProtocolException** &ex) throw ()  
*Copy Constructor.*
- **ProtocolException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **ProtocolException** (const std::exception \*cause) throw ()  
*Constructor.*
- **ProtocolException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*

- virtual **ProtocolException** \* **clone** () const  
*Clones this exception.*
- virtual ~**ProtocolException** () throw ()

### 6.652.1 Constructor & Destructor Documentation

#### 6.652.1.1 decaf::net::ProtocolException::ProtocolException ( ) throw () [inline]

Default Constructor.

#### 6.652.1.2 decaf::net::ProtocolException::ProtocolException ( const Exception & ex ) throw () [inline]

Conversion Constructor from some other Exception.

##### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

#### 6.652.1.3 decaf::net::ProtocolException::ProtocolException ( const ProtocolException & ex ) throw () [inline]

Copy Constructor.

##### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

#### 6.652.1.4 decaf::net::ProtocolException::ProtocolException ( const char \* *file*, const int *lineNumber*, const std::exception \* *cause*, const char \* *msg*, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.  
Sets the message to report, using an optional list of arguments to parse into the message

##### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.652.1.5** `decaf::net::ProtocolException::ProtocolException ( const std::exception * cause )  
throw () [inline]`

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.652.1.6** `decaf::net::ProtocolException::ProtocolException ( const char * file, const int  
lineNumber, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.652.1.7** `virtual decaf::net::ProtocolException::~~ProtocolException ( ) throw ()  
[inline, virtual]`

## 6.652.2 Member Function Documentation

**6.652.2.1** `virtual ProtocolException* decaf::net::ProtocolException::clone ( ) const  
[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 2212).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ProtocolException.h`

## 6.653 decaf::security::PublicKey Class Reference

A public key.

```
#include <src/main/decaf/security/PublicKey.h>
```

Inheritance diagram for decaf::security::PublicKey:

### Public Member Functions

- virtual  $\sim$ **PublicKey** ()

#### 6.653.1 Detailed Description

A public key. This interface contains no methods or constants. It merely serves to group (and provide type safety for) all public key interfaces.

#### 6.653.2 Constructor & Destructor Documentation

**6.653.2.1** virtual decaf::security::PublicKey::~~PublicKey ( ) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/security/**PublicKey.h**

## 6.654 decaf::io::PushbackInputStream Class Reference

A **PushbackInputStream** (p. 3231) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

```
#include <src/main/decaf/io/PushbackInputStream.h>
```

Inheritance diagram for decaf::io::PushbackInputStream:

### Public Member Functions

- **PushbackInputStream** (**InputStream** \*stream, bool own=false)  
*Creates a **PushbackInputStream** (p. 3231) and saves its argument, the input stream in, for later use.*
- **PushbackInputStream** (**InputStream** \*stream, int bufSize, bool own=false)  
throw ( decaf::lang::exceptions::IllegalArgumentException )

Creates a **PushbackInputStream** (p. 3231) and saves its argument, the input stream in, for later use.

- virtual **~PushbackInputStream** ()
- void **unread** (unsigned char value) throw ( decaf::io::IOException )  
*Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.*
- void **unread** (const unsigned char \*buffer, int size) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

*Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.*

- void **unread** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

*Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.*

- virtual int **available** () const throw ( decaf::io::IOException )

*Indicates the number of bytes available.*

*The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.*

*The default implementation of this method returns zero.*

#### Returns

*the number of bytes available on this input stream.*

#### Exceptions

<b>IOException</b> (p. 2210)	if an I/O error occurs.
------------------------------	-------------------------

- virtual long long **skip** (long long num) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )

*Skips over and discards n bytes of data from this input stream.*

*The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.*

*The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

#### Parameters

num	The number of bytes to skip.
-----	------------------------------

#### Returns

*total bytes skipped*

*Exceptions*

<b>IOException</b> (p. 2210)	<i>if an I/O error occurs.</i>
UnsupportedOperationException	<i>if the concrete stream class does not support skipping bytes.</i>

- virtual void **mark** (int readLimit)  
*Does nothing except throw an **IOException** (p. 2210).*
- virtual void **reset** () throw ( decaf::io::IOException )  
*Does nothing except throw an **IOException** (p. 2210).*
- virtual bool **markSupported** () const  
*Does nothing except throw an **IOException** (p. 2210).*

**Protected Member Functions**

- virtual int **doReadByte** () throw ( decaf::io::IOException )
- virtual int **doReadArrayBounded** (unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

**6.654.1 Detailed Description**

A **PushbackInputStream** (p. 3231) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte. This is useful in situations where it is convenient for a fragment of code to read an indefinite number of data bytes that are delimited by a particular byte value; after reading the terminating byte, the code fragment can "unread" it, so that the next read operation on the input stream will reread the byte that was pushed back. For example, bytes representing the characters constituting an identifier might be terminated by a byte representing an operator character; a method whose job is to read just an identifier can read until it sees the operator and then push the operator back to be re-read.

**Since**

1.0

**6.654.2 Constructor & Destructor Documentation****6.654.2.1 decaf::io::PushbackInputStream::PushbackInputStream ( InputStream \* stream, bool own = false )**

Creates a **PushbackInputStream** (p. 3231) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

**Parameters**

<i>stream</i>	The <b>InputStream</b> (p. 2105) instance to wrap.
<i>Boolean</i>	value indicating if this <b>FilterInputStream</b> (p. 1950) owns the wrapped stream.

**6.654.2.2** decaf::io::PushbackInputStream::PushbackInputStream ( **InputStream** \* *stream*, int *bufSize*, bool *own* = false ) throw ( decaf::lang::exceptions::IllegalArgumentException )

Creates a **PushbackInputStream** (p. 3231) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

**Parameters**

<i>stream</i>	The <b>InputStream</b> (p. 2105) instance to wrap.
<i>bufSize</i>	The number of byte to allocate for pushback into this stream.
<i>Boolean</i>	value indicating if this <b>FilterInputStream</b> (p. 1950) owns the wrapped stream.

**Exceptions**

<i>IllegalArgumentException</i>	if the bufSize argument is < zero.
---------------------------------	------------------------------------

**6.654.2.3** virtual decaf::io::PushbackInputStream::~~PushbackInputStream ( ) [virtual]

**6.654.3 Member Function Documentation**

**6.654.3.1** virtual int decaf::io::PushbackInputStream::available ( ) const throw ( decaf::io::IOException ) [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

**Returns**

the number of bytes available on this input stream.

**Exceptions**

<i>IOException</i> (p. 2210)	if an I/O error occurs.
---------------------------------	-------------------------

Returns the sum of the number of pushed back bytes if any and the amount of bytes available in the underlying stream via a call to `available`.

Reimplemented from **decaf::io::FilterInputStream** (p. 1953).

```
6.654.3.2  virtual int decaf::io::PushbackInputStream::doReadArrayBounded ( unsigned char
* buffer, int size, int offset, int length ) throw ( decaf::io::IOException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::NullPointerException ) [protected,
virtual]
```

Reimplemented from **decaf::io::FilterInputStream** (p. 1954).

```
6.654.3.3  virtual int decaf::io::PushbackInputStream::doReadByte ( ) throw (
decaf::io::IOException ) [protected, virtual]
```

Reimplemented from **decaf::io::FilterInputStream** (p. 1954).

```
6.654.3.4  virtual void decaf::io::PushbackInputStream::mark ( int readLimit ) [virtual]
```

Does nothing except throw an **IOException** (p. 2210).

Marks the current position in the stream A subsequent call to the `reset` method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the `reset` method is called so long the `readLimit` is not reached.

Calling `mark` on a closed stream instance should have no effect.

The default implementation of this method does nothing.

#### Parameters

<i>readLimit</i>	The max bytes read before marked position is invalid.
------------------	---

Reimplemented from **decaf::io::FilterInputStream** (p. 1955).

```
6.654.3.5  virtual bool decaf::io::PushbackInputStream::markSupported ( ) const
[inline, virtual]
```

Does nothing except throw an **IOException** (p. 2210).

Determines if this input stream supports the `mark` and `reset` methods.

Whether or not `mark` and `reset` are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

**Returns**

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1955).

**6.654.3.6** `virtual void decaf::io::PushbackInputStream::reset ( ) throw ( decaf::io::IOException )` [virtual]

Does nothing except throw an **IOException** (p. 2210).

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: \* If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2210) might be thrown. \* If such an **IOException** (p. 2210) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: \* The call to reset may throw an **IOException** (p. 2210). \* If an **IOException** (p. 2210) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 2210).

**Exceptions**

<b>IOException</b> (p. 2210)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::FilterInputStream** (p. 1956).

**6.654.3.7** `virtual long long decaf::io::PushbackInputStream::skip ( long long num ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )` [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached.

Subclasses are encouraged to provide a more efficient implementation of this method.

#### Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

#### Returns

total bytes skipped

#### Exceptions

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
<b><i>UnsupportedOperationException</i></b>	if the concrete stream class does not support skipping bytes.

This method first skips bytes in the local pushed back buffer before attempting to complete the request by calling the underlying stream skip method with the remainder of bytes that needs to be skipped.

Reimplemented from **decaf::io::FilterInputStream** (p. 1956).

**6.654.3.8** void decaf::io::PushbackInputStream::unread ( const unsigned char \* *buffer*, int *size* ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

#### Parameters

<i>buffer</i>	The bytes to copy to the front of push back buffer.
<i>size</i>	The size of the array to be copied.

#### Exceptions

<b><i>NullPointerException</i></b>	if the buffer passed is NULL.
<b><i>IndexOutOfBoundsException</i></b>	if the size value given is negative.
<b><i>IOException</i></b> (p. 2210)	if there is not enough space in the pushback buffer or this stream has already been closed.

**6.654.3.9** void decaf::io::PushbackInputStream::unread ( const unsigned char \*  
*buffer*, int *size*, int *offset*, int *length* ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::NullPointerException )

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

#### Parameters

<i>buffer</i>	The bytes to copy to the front of push back buffer.
<i>size</i>	The size of the array to be copied.
<i>offset</i>	The position in the buffer to start copying from.
<i>length</i>	The number of bytes to push back from the passed buffer.

#### Exceptions

<i>NullPointerException</i>	if the buffer passed is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length is greater than the buffer size.
<i>IOException</i> (p. 2210)	if there is not enough space in the pushback buffer or this stream has already been closed.

**6.654.3.10** void decaf::io::PushbackInputStream::unread ( unsigned char *value* ) throw ( decaf::io::IOException )

Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

#### Parameters

<i>value</i>	The byte that is to be placed at the front of the push back buffer.
--------------	---

#### Exceptions

<i>IOException</i> (p. 2210)	if there is not enough space in the pushback buffer or this stream has already been closed.
---------------------------------	---

The documentation for this class was generated from the following file:

- src/main/decaf/io/**PushbackInputStream.h**

## 6.655 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

```
#include <src/main/cms/Queue.h>
```

Inheritance diagram for cms::Queue:

## Public Member Functions

- virtual `~Queue()`
- virtual `std::string getQueueName() const` `=0` throw ( `CMSEException` )  
*Gets the name of this queue.*

### 6.655.1 Detailed Description

An interface encapsulating a provider-specific queue name. Messages sent to a **Queue** (p. 3238) are sent to a Single Subscriber on that **Queue** (p. 3238) **Destination** (p. 1776). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 2614) in a **Queue** (p. 3238) is not defined by the CMS API, consult your Provider documentation for this information.

#### Since

1.0

### 6.655.2 Constructor & Destructor Documentation

6.655.2.1 `virtual cms::Queue::~~Queue()` `[inline, virtual]`

### 6.655.3 Member Function Documentation

6.655.3.1 `virtual std::string cms::Queue::getQueueName()` `const` throw ( `CMSEException` )  
`[pure virtual]`

Gets the name of this queue.

#### Returns

The queue name.

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implemented in `activemq::commands::ActiveMQQueue` (p. 483).

The documentation for this class was generated from the following file:

- src/main/cms/Queue.h

## 6.656 decaf::util::Queue< E > Class Template Reference

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

```
#include <src/main/decaf/util/Queue.h>
```

Inheritance diagram for decaf::util::Queue< E >:

### Public Member Functions

- virtual **~Queue** ()
- virtual bool **offer** (const E &value)=0 throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException )  
*Inserts the specified element into the queue provided that the condition allows such an operation.*
- virtual bool **poll** (E &result)=0  
*Gets and removes the element in the head of the queue.*
- virtual E **remove** ()=0 throw ( decaf::lang::exceptions::NoSuchElementException )  
*Gets and removes the element in the head of the queue.*
- virtual bool **peek** (E &result) const =0  
*Gets but not removes the element in the head of the queue.*
- virtual E **element** () const =0 throw ( decaf::lang::exceptions::NoSuchElementException )  
*Gets but not removes the element in the head of the queue.*

### 6.656.1 Detailed Description

```
template<typename E> class decaf::util::Queue< E >
```

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection. Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

**Queue** (p. 3239) does not provide blocking queue methods, which will block until the operation of the method is allowed. `BlockingQueue` interface defines such methods.

Unlike the Java **Queue** (p. 3239) interface the methods of this class cannot return null to indicate that a **Queue** (p. 3239) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java **Queue** (p. 3239) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 3239) must be *assignable* in order to utilize these methods.

### Since

1.0

## 6.656.2 Constructor & Destructor Documentation

**6.656.2.1** `template<typename E> virtual decaf::util::Queue< E>::~Queue ( )`  
[inline, virtual]

## 6.656.3 Member Function Documentation

**6.656.3.1** `template<typename E> virtual E decaf::util::Queue< E>::element ( ) const`  
`throw ( decaf::lang::exceptions::NoSuchElementException )` [pure  
virtual]

Gets but not removes the element in the head of the queue.

Throws a `NoSuchElementException` if there is no element in the queue.

### Returns

the element in the head of the queue.

### Exceptions

<i>NoSuchElementException</i>	if there is no element in the queue.
-------------------------------	--------------------------------------

Implemented in `decaf::util::AbstractQueue< E>` (p. 178).

**6.656.3.2** `template<typename E> virtual bool decaf::util::Queue< E>::offer ( const`  
`E & value ) throw ( decaf::lang::exceptions::NullPointerException,`  
`decaf::lang::exceptions::IllegalArgumentException )` [pure  
virtual]

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

### Parameters

<i>value</i>	the specified element to insert into the queue.
--------------	---

### Returns

true if the operation succeeds and false if it fails.

### Exceptions

<i>NullPointerException</i>	if the <b>Queue</b> (p. 3239) implementation does not allow Null values to be inserted into the <b>Queue</b> (p. 3239).
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::SynchronousQueue< E >** (p. 3834), and **decaf::util::PriorityQueue< E >** (p. 3121).

Referenced by **decaf::util::AbstractQueue< E >::add()**.

**6.656.3.3** `template<typename E> virtual bool decaf::util::Queue< E >::peek ( E & result ) const [pure virtual]`

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

### Parameters

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

### Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::PriorityQueue< E >** (p. 3122).

Referenced by **decaf::util::AbstractQueue< E >::element()**.

**6.656.3.4** `template<typename E> virtual bool decaf::util::Queue< E >::poll ( E & result ) [pure virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 3239) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

**Parameters**

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

**Returns**

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::concurrent::SynchronousQueue< E >** (p. 3835), and **decaf::util::PriorityQueue< E >** (p. 3122).

Referenced by **decaf::util::AbstractQueue< E >::clear()**, and **decaf::util::AbstractQueue< E >::remove()**.

```
6.656.3.5  template<typename E> virtual E decaf::util::Queue< E >::remove ( )
           throw ( decaf::lang::exceptions::NoSuchElementException ) [pure
           virtual]
```

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** if there is no element in the queue.

**Returns**

the element in the head of the queue.

**Exceptions**

<i>NoSuchElementException</i>	if there is no element in the queue.
-------------------------------	--------------------------------------

Implemented in **decaf::util::AbstractQueue< E >** (p. 179), and **decaf::util::PriorityQueue< E >** (p. 3123).

The documentation for this class was generated from the following file:

- **src/main/decaf/util/Queue.h**

**6.657 cms::QueueBrowser Class Reference**

This class implements in interface for browsing the messages in a **Queue** (p. 3238) without removing them.

```
#include <src/main/cms/QueueBrowser.h>
```

Inheritance diagram for **cms::QueueBrowser**:

## Public Member Functions

- virtual `~QueueBrowser()`
- virtual const `Queue * getQueue()` const =0 throw ( cms::CMSException )
- virtual std::string `getMessageSelector()` const =0 throw ( cms::CMSException )
- virtual `cms::MessageEnumeration * getEnumeration()`=0 throw ( cms::CMSException )

*Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue (p. 3238) in the order that a client would receive them.*

### 6.657.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p. 3238) without removing them. To browse the contents of the **Queue** (p. 3238) the client calls the `getEnumeration` method to retrieve a new instance of a **Queue** (p. 3238) Enumerator. The client then calls the `hasMoreMessages` method of the Enumeration, if it returns true the client can safely call the `nextMessage` method of the Enumeration instance.

```
Enumeration* enumeration = queueBrowser->getEnumeration() (p. 3244);
while( enumeration->hasMoreMessages() ) { cms::Message (p. 2614)* message =
enumeration->nextMessage();
// ... Do something with the Message (p. 2614).
delete message; }
```

Since

1.1

### 6.657.2 Constructor & Destructor Documentation

6.657.2.1 virtual cms::QueueBrowser::~QueueBrowser ( ) [inline, virtual]

### 6.657.3 Member Function Documentation

6.657.3.1 virtual cms::MessageEnumeration\* cms::QueueBrowser::getEnumeration ( ) throw ( cms::CMSException ) [pure virtual]

Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 3238) in the order that a client would receive them.

The pointer returned is owned by the browser and should not be deleted by the client application.

**Returns**

a pointer to a **Queue** (p. 3238) Enumeration, this Pointer is owned by the **Queue-Browser** (p. 3243) and should not be deleted by the client.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	if an internal error occurs.
--	------------------------------

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 485).

**6.657.3.2** `virtual std::string cms::QueueBrowser::getMessageSelector ( ) const throw ( cms::CMSEException ) [pure virtual]`

**Returns**

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	if an internal error occurs.
--	------------------------------

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 485).

**6.657.3.3** `virtual const Queue* cms::QueueBrowser::getQueue ( ) const throw ( cms::CMSEException ) [pure virtual]`

**Returns**

the **Queue** (p. 3238) that this browser is listening on.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	if an internal error occurs.
--	------------------------------

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 485).

## 6.658 decaf::util::Random Class Reference

**Random** (p. 3245) Value Generator which is used to generate a stream of pseudorandom numbers.

```
#include <src/main/decaf/util/Random.h>
```

Inheritance diagram for decaf::util::Random:

## Public Member Functions

- **Random ()**  
*Construct a random generator with the current time of day in milliseconds as the initial state.*
- **Random (unsigned long long seed)**  
*Construct a random generator with the given `seed` as the initial state.*
- **bool nextBoolean ()**  
*Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.*
- **double nextDouble ()**  
*Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.*
- **float nextFloat ()**  
*Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.*
- **double nextGaussian ()**  
*Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the polar method of G.*
- **int nextInt ()**  
*Generates a uniformly distributed 32-bit `int` value from the this random number sequence.*
- **int nextInt (int n)**  
*Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).*
- **long long nextLong ()**  
*Generates a uniformly distributed 64-bit `int` value from the this random number sequence.*
- **virtual void nextBytes (std::vector< unsigned char > &buf)**  
*Modifies the byte array by a random sequence of bytes generated by this random number generator.*
- **virtual void nextBytes (unsigned char \*buf, int size)**

*Modifies the byte array by a random sequence of bytes generated by this random number generator.*

- virtual void **setSeed** (unsigned long long seed)

*Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2, Section 3.2.1.**

## Protected Member Functions

- virtual int **next** (int bits)

*Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.*

### 6.658.1 Detailed Description

**Random** (p. 3245) Value Generator which is used to generate a stream of pseudorandom numbers. The algorithms implemented by class **Random** (p. 3245) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

#### Since

1.0

### 6.658.2 Constructor & Destructor Documentation

#### 6.658.2.1 `decaf::util::Random::Random ( )`

Construct a random generator with the current time of day in milliseconds as the initial state.

#### See also

**setSeed** (p. 3251)

#### 6.658.2.2 `decaf::util::Random::Random ( unsigned long long seed )`

Construct a random generator with the given `seed` as the initial state.

#### Parameters

<code>seed</code>	the seed that will determine the initial state of this random number generator
-------------------	--

#### See also

**setSeed** (p. 3251)

### 6.658.3 Member Function Documentation

#### 6.658.3.1 virtual int decaf::util::Random::next ( int *bits* ) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

#### Returns

`int` a pseudo-random generated `int` number

#### Parameters

<i>bits</i>	number of bits of the returned value
-------------	--------------------------------------

#### See also

**nextBytes** (p. 3249)  
**nextDouble** (p. 3249)  
**nextFloat** (p. 3249)  
**nextInt()** (p. 3250)  
**nextInt(int)** (p. 3250)  
**nextGaussian** (p. 3249)  
**nextLong** (p. 3250)

Reimplemented in **decaf::security::SecureRandom** (p. 3427).

#### 6.658.3.2 bool decaf::util::Random::nextBoolean ( )

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

#### Returns

boolean a pseudo-random, uniformly distributed boolean value

#### 6.658.3.3 virtual void decaf::util::Random::nextBytes ( unsigned char \* *buf*, int *size* ) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

#### Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

**See also****next** (p. 3247)**Exceptions**

<i>NullPointerException</i>	if buff is NULL
<i>IllegalArgumentException</i>	if size is negative

Reimplemented in **decaf::security::SecureRandom** (p. 3427).

**6.658.3.4** `virtual void decaf::util::Random::nextBytes ( std::vector< unsigned char > & buf )`  
 [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

**Parameters**

<i>buf</i>	non-null array to contain the new random bytes
------------	--

**See also****next** (p. 3247)Reimplemented in **decaf::security::SecureRandom** (p. 3428).

**6.658.3.5** `double decaf::util::Random::nextDouble ( )`

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

**Returns**

double

**See also****nextFloat** (p. 3249)

**6.658.3.6** `float decaf::util::Random::nextFloat ( )`

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

**Returns**

float a random float number between 0.0 and 1.0

**See also**

**nextDouble** (p. 3249)

**6.658.3.7 double decaf::util::Random::nextGaussian ( )**

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the *polar method* of G.

E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

**Returns**

`double`

**See also**

**nextDouble** (p. 3249)

**6.658.3.8 int decaf::util::Random::nextInt ( )**

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

**Returns**

`int` uniformly distributed `int` value

**See also**

**next** (p. 3247)

**nextLong** (p. 3250)

**6.658.3.9 int decaf::util::Random::nextInt ( int n )**

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

**Parameters**

<code>n</code>	The <code>int</code> value that defines the max value of the return.
----------------	--

**Returns**

the next pseudo random `int` value.

**Exceptions**

<i>IllegalArgumentException</i>	if <code>n</code> is less than or equal to zero.
---------------------------------	--

**6.658.3.10** `long long decaf::util::Random::nextLong ( )`

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

**Returns**

64-bit `int` random number

**See also**

**next** (p. 3247)  
**nextInt()** (p. 3250)  
**nextInt(int)** (p. 3250)

**6.658.3.11** `virtual void decaf::util::Random::setSeed ( unsigned long long seed )`  
[virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

**Parameters**

<i>seed</i>	the seed that alters the state of the random number generator
-------------	---

**See also**

**next** (p. 3247)  
**Random()** (p. 3247)  
**#Random(long)**

Reimplemented in **decaf::security::SecureRandom** (p. 3429).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Random.h`

**6.659** `decaf::lang::Readable` Class Reference

A **Readable** (p. 3251) is a source of characters.

```
#include <src/main/decaf/lang/Readable.h>
```

Inheritance diagram for decaf::lang::Readable:

## Public Member Functions

- virtual **~Readable** ()
- virtual int **read** (**decaf::nio::CharBuffer** \*charBuffer)=0 throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException )

*Attempts to read characters into the specified character buffer.*

### 6.659.1 Detailed Description

A **Readable** (p. 3251) is a source of characters. Characters from a **Readable** (p. 3251) are made available to callers of the read method via a CharBuffer.

Since

1.0

### 6.659.2 Constructor & Destructor Documentation

6.659.2.1 virtual decaf::lang::Readable::~~Readable ( ) [inline, virtual]

### 6.659.3 Member Function Documentation

6.659.3.1 virtual int decaf::lang::Readable::read ( decaf::nio::CharBuffer \* *charBuffer* ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException ) [pure virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

#### Parameters

<i>charBuffer</i>	The Buffer to read Characters into.
-------------------	-------------------------------------

#### Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

**Exceptions**

<i>IOException</i>	- if an I/O error occurs
<i>NullPointerException</i>	- if buffer is NULL.
<i>ReadOnlyBufferException</i>	- if charBuffer is a read only buffer

Implemented in **decaf::io::Reader** (p. 3258).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Readable.h**

**6.660 activemq::transport::inactivity::ReadChecker Class Reference**

Runnable class that is used by the {.

```
#include <src/main/activemq/transport/inactivity/ReadChecker.h>
```

Inheritance diagram for activemq::transport::inactivity::ReadChecker:

**Public Member Functions**

- **ReadChecker** (**InactivityMonitor** \*parent)
- virtual **~ReadChecker** ()
- virtual void **run** ()

*Run method - called by the Thread class in the context of the thread.*

**6.660.1 Detailed Description**

Runnable class that is used by the {.

**See also**

**InactivityMonitor** (p. 2065)} class the check for timeouts related to **transport** (p. 99) reads.

**Since**

3.1

## 6.660.2 Constructor & Destructor Documentation

6.660.2.1 `activemq::transport::inactivity::ReadChecker::ReadChecker ( InactivityMonitor * parent )`

6.660.2.2 `virtual activemq::transport::inactivity::ReadChecker::~~ReadChecker ( )`  
[virtual]

## 6.660.3 Member Function Documentation

6.660.3.1 `virtual void activemq::transport::inactivity::ReadChecker::run ( )` [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 3419).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/inactivity/ReadChecker.h`

## 6.661 decaf::io::Reader Class Reference

*Override this method to customize the functionality of the method read( CharBuffer\* charBuffer ).*

### 6.661.1 Constructor & Destructor Documentation

6.661.1.1 `decaf::io::Reader::Reader ( )` [protected]

6.661.1.2 `virtual decaf::io::Reader::~~Reader ( )` [virtual]

### 6.661.2 Member Function Documentation

6.661.2.1 `virtual int decaf::io::Reader::doReadArray ( char * buffer, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException )`  
[protected, virtual]

Override this method to customize the functionality of the method `read( char* buffer, std::size_t length )`.

6.661.2.2 `virtual int decaf::io::Reader::doReadArrayBounded ( char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )`  
[protected, pure virtual]

Override this method to customize the functionality of the method `read( unsigned char* buffer, int size, int offset, int length )`.

All subclasses must override this method to provide the basic **Reader** (p. 3254) functionality.

Implemented in **decaf::io::InputStreamReader** (p. 2118).

6.661.2.3 `virtual int decaf::io::Reader::doReadChar ( ) throw ( decaf::io::IOException )`  
[protected, virtual]

Override this method to customize the functionality of the method `read()` (p. 3257).

6.661.2.4 `virtual int decaf::io::Reader::doReadCharBuffer ( decaf::nio::CharBuffer * charBuffer ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException )` [protected, virtual]

Override this method to customize the functionality of the method `read( CharBuffer* charBuffer )`.

6.661.2.5 `virtual int decaf::io::Reader::doReadVector ( std::vector< char > & buffer ) throw ( decaf::io::IOException )` [protected, virtual]

Override this method to customize the functionality of the method `read( std::vector<char>& buffer )` (p. 3259).

**6.661.2.6** `virtual void decaf::io::Reader::mark ( int readAheadLimit ) throw ( decaf::io::IOException )` [virtual]

Marks the present position in the stream.

Subsequent calls to **reset()** (p. 3260) will attempt to reposition the stream to this point. Not all character-input streams support the **mark()** (p. 3256) operation.

#### Parameters

<i>readAheadLimit</i>	Limit on the number of characters that may be read while still preserving the mark. After reading this many characters, attempting to reset the stream may fail.
-----------------------	--

#### Exceptions

<b>IOException</b> (p. 2210)	if an I/O error occurs, or the stream does not support mark.
---------------------------------	--

**6.661.2.7** `virtual bool decaf::io::Reader::markSupported ( ) const` [inline, virtual]

Tells whether this stream supports the **mark()** (p. 3256) operation.

The default implementation always returns false. Subclasses should override this method.

#### Returns

true if and only if this stream supports the mark operation.

**6.661.2.8** `virtual int decaf::io::Reader::read ( char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )` [virtual]

Reads characters into a portion of an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

#### Parameters

<i>buffer</i>	The target char buffer.
<i>size</i>	The size in bytes of the target buffer.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The maximum number of bytes to read.

#### Returns

The number of bytes read or -1 if the end of stream is reached.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	thrown if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length is greater than the array size.

**6.661.2.9** virtual int decaf::io::Reader::read ( ) throw ( decaf::io::IOException )  
[virtual]

Reads a single character.

This method will block until a character is available, an I/O error occurs, or the end of the stream is reached.

Subclasses that intend to support efficient single-character input should override this method.

**Returns**

The character read, as an integer in the range 0 to 65535 (0x00-0xffff), or -1 if the end of the stream has been reached.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	thrown if an I/O error occurs.
--	--------------------------------

**6.661.2.10** virtual int decaf::io::Reader::read ( char \* *buffer*, int *size* ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException ) [virtual]

Reads characters into an array, the method will attempt to read as much data as the size of the array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

**Parameters**

<i>buffer</i>	The target char buffer.
<i>size</i>	The size in bytes of the target buffer.

**Returns**

The number of bytes read or -1 if the end of stream is reached.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	thrown if an I/O error occurs.
<b><i>NullPointerException</i></b>	if buffer is NULL.

**6.661.2.11** `virtual int decaf::io::Reader::read ( decaf::nio::CharBuffer * charBuffer ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException ) [virtual]`

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

**Parameters**

<i>charBuffer</i>	The Buffer to read Characters into.
-------------------	-------------------------------------

**Returns**

The number of char values added to the buffer, or -1 if this source of characters is at its end

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	- if an I/O error occurs
<b><i>NullPointerException</i></b>	- if buffer is NULL.
<b><i>ReadOnlyBufferException</i></b>	- if charBuffer is a read only buffer

Implements **decaf::lang::Readable** (p. 3252).

**6.661.2.12** `virtual int decaf::io::Reader::read ( std::vector< char > & buffer ) throw ( decaf::io::IOException ) [virtual]`

Reads characters into an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

**Parameters**

<i>buffer</i>	The buffer to read characters into.
---------------	-------------------------------------

**Returns**

The number of characters read, or -1 if the end of the stream has been reached

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	thrown if an I/O error occurs.
--	--------------------------------

**6.661.2.13** `virtual bool decaf::io::Reader::ready ( ) const throw ( decaf::io::IOException )`  
[virtual]

Tells whether this stream is ready to be read.

**Returns**

True if the next **read()** (p. 3257) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

Reimplemented in **decaf::io::InputStreamReader** (p. 2118).

**6.661.2.14** `virtual void decaf::io::Reader::reset ( ) throw ( decaf::io::IOException )`  
[virtual]

Resets the stream.

If the stream has been marked, then attempt to reposition it at the mark. If the stream has not been marked, then attempt to reset it in some way appropriate to the particular stream, for example by repositioning it to its starting point. Not all character-input streams support the **reset()** (p. 3260) operation, and some support **reset()** (p. 3260) without supporting **mark()** (p. 3256).

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

**6.661.2.15** `virtual long long decaf::io::Reader::skip ( long long count ) throw ( decaf::io::IOException )` [virtual]

Skips characters.

This method will block until some characters are available, an I/O error occurs, or the end of the stream is reached.

**Parameters**

<i>count</i>	The number of character to skip.
--------------	----------------------------------

**Returns**

the number of Character actually skipped.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

### 6.662.1 Constructor & Destructor Documentation

**6.662.1.1** `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( ) throw ()`  
[inline]

Default Constructor.

**6.662.1.2** `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( const lang::Exception & ex ) throw ()` [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

**6.662.1.3** `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( const ReadOnlyBufferException & ex ) throw ()` [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

**6.662.1.4** `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( const char * file, const int lineNumber, const std::exception * cause, const char * msg, ... ) throw ()`  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.662.1.5** `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( const std::exception * cause ) throw () [inline]`

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.662.1.6** `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor.

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.662.1.7** `virtual decaf::nio::ReadOnlyBufferException::~~ReadOnlyBufferException ( ) throw () [inline, virtual]`

### 6.662.2 Member Function Documentation

**6.662.2.1** `virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone ( )const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::UnsupportedOperationException** (p. 4030).

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/ReadOnlyBufferException.h`

## 6.663 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p. 3263) maintains a pair of associated locks, one for read-only operations and one for writing.

```
#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>
```

## Public Member Functions

- virtual **~ReadWriteLock** ()
- virtual **Lock & readLock** ()=0  
*Returns the lock used for reading.*
- virtual **Lock & writeLock** ()=0  
*Returns the lock used for writing.*

### 6.663.1 Detailed Description

A **ReadWriteLock** (p. 3263) maintains a pair of associated locks, one for read-only operations and one for writing. The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 3263) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 2452) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

- \* Determining whether to grant the read lock or the write lock, when both readers and

writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible. \*

Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency. \*

Determining whether the locks are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant? \*

Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

### 6.665.1 Detailed Description

Interface for a **RedeliveryPolicy** (p. 3267) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.

Since

3.2.0

## 6.665.2 Constructor & Destructor Documentation

6.665.2.1 `activemq::core::RedeliveryPolicy::RedeliveryPolicy ( )` `[protected]`

6.665.2.2 `virtual activemq::core::RedeliveryPolicy::~~RedeliveryPolicy ( )` `[virtual]`

## 6.665.3 Member Function Documentation

6.665.3.1 `virtual RedeliveryPolicy* activemq::core::RedeliveryPolicy::clone ( ) const`  
`[pure virtual]`

Create a copy of this Policy and return it.

### Returns

pointer to a new **RedeliveryPolicy** (p. 3267) that is a copy of this one.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1731).

6.665.3.2 `virtual void activemq::core::RedeliveryPolicy::configure ( const`  
`decaf::util::Properties & properties )` `[virtual]`

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix `cms.RedeliveryPolicy.XXX` where `XXX` is the name of a property with a public setter method. For instance `cms.RedeliveryPolicy.useExponentialBackOff` will be used to set the value of the use exponential back off toggle.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

### Parameters

<i>properties</i>	The Properties object used to configure this object.
-------------------	--

### Exceptions

<i>NumberFormatException</i>	if a property that is numeric cannot be converted
<i>IllegalArgumentException</i>	if a property can't be converted to the correct type.

**6.665.3.3** `virtual double activemq::core::RedeliveryPolicy::getBackOffMultiplier ( ) const`  
[pure virtual]

#### Returns

The value of the Back-Off Multiplier for Message Redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1732).

**6.665.3.4** `virtual short activemq::core::RedeliveryPolicy::getCollisionAvoidancePercent ( ) const`  
[pure virtual]

#### Returns

the currently set Collision Avoidance percentage.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1732).

**6.665.3.5** `virtual long long activemq::core::RedeliveryPolicy::getInitialRedeliveryDelay ( ) const`  
[pure virtual]

Gets the initial time that redelivery of messages is delayed.

#### Returns

the time in milliseconds that redelivery is delayed initially.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1732).

**6.665.3.6** `virtual int activemq::core::RedeliveryPolicy::getMaximumRedeliveries ( ) const`  
[pure virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

#### Returns

maximum allowed redeliveries for a message.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1732).

**6.665.3.7** `virtual long long activemq::core::RedeliveryPolicy::getRedeliveryDelay ( long long`  
*previousDelay* ) [pure virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

#### Parameters

<i>previousDelay</i>	The last delay that was used between message redeliveries.
----------------------	--

**Returns**

the new delay to use before attempting another redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1732).

**6.665.3.8** `virtual bool activemq::core::RedeliveryPolicy::isUseCollisionAvoidance ( ) const`  
[pure virtual]

**Returns**

whether or not collision avoidance is enabled for this Policy.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1733).

**6.665.3.9** `virtual bool activemq::core::RedeliveryPolicy::isUseExponentialBackOff ( ) const`  
[pure virtual]

**Returns**

whether or not the exponential back off option is enabled.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1733).

**6.665.3.10** `virtual void activemq::core::RedeliveryPolicy::setBackOffMultiplier ( double value )`  
[pure virtual]

Sets the Back-Off Multiplier for Message Redelivery.

**Parameters**

<i>value</i>	The new value for the back-off multiplier.
--------------	--

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1733).

**6.665.3.11** `virtual void activemq::core::RedeliveryPolicy::setCollisionAvoidancePercent ( short value )` [pure virtual]

**Parameters**

<i>value</i>	The collision avoidance percentage setting.
--------------	---

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1733).

**6.665.3.12** `virtual void activemq::core::RedeliveryPolicy::setInitialRedeliveryDelay ( long long value ) [pure virtual]`

Sets the initial time that redelivery will be delayed.

#### Parameters

<i>value</i>	Time in Milliseconds to wait before starting redelivery.
--------------	--

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1734).

**6.665.3.13** `virtual void activemq::core::RedeliveryPolicy::setMaximumRedeliveries ( int maximumRedeliveries ) [pure virtual]`

Sets the Maximum allowable redeliveries for a Message.

#### Parameters

<i>maximum-Redeliveries</i>	The maximum number of times that a message will be redelivered.
-----------------------------	---

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1734).

**6.665.3.14** `virtual void activemq::core::RedeliveryPolicy::setUseCollisionAvoidance ( bool value ) [pure virtual]`

#### Parameters

<i>value</i>	Enable or Disable collision avoidance for this Policy.
--------------	--

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1734).

**6.665.3.15** `virtual void activemq::core::RedeliveryPolicy::setUseExponentialBackOff ( bool value ) [pure virtual]`

#### Parameters

<i>value</i>	Enable or Disable the exponential back off multiplier option.
--------------	---

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1734).

## 6.665.4 Field Documentation

*Returns true if this lock has fairness set true.*

- `std::string toString () const`

*Returns a string identifying this lock, as well as its lock state.*

### 6.666.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 2452) with extended capabilities. A **ReentrantLock** (p. 3273) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking lock will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods **isHeldByCurrentThread()** (p. 3275), and **getHoldCount()** (p. 3275).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, locks favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair locks accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain locks and guarantee lack of starvation. Note however, that fairness of locks does not guarantee fairness of thread scheduling. Thus, one of many threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the lock. Also note that the untimed tryLock method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

```
class X { private:
```

```
    ReentrantLock (p. 3273) lock; // ...
```

```
public:
```

```
    void m() { lock.lock(); // block until condition holds
```

```
    try { // ... method body } finally { lock.unlock() } } }
```

In addition to implementing the **Lock** (p. 2452) interface, this class defines methods **isLocked** and **getLockQueueLength**, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

**Since**

1.0

## 6.666.2 Constructor & Destructor Documentation

6.666.2.1 `decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ( )`

6.666.2.2 `virtual decaf::util::concurrent::locks::ReentrantLock::~~ReentrantLock ( )`  
[virtual]

## 6.666.3 Member Function Documentation

6.666.3.1 `int decaf::util::concurrent::locks::ReentrantLock::getHoldCount ( ) const`

Queries the number of holds on this lock by the current thread.

A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of code should not be entered with the lock already held then we can assert that fact:

```
class X { private:
```

```
    ReentrantLock (p. 3273) lock; // ...
```

```
public:
```

```
void m() { assert( lock.getHoldCount() == 0 ); lock.lock(); try { // ... method body }  
catch(...) { lock.unlock(); } } }
```

### Returns

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.666.3.2 `bool decaf::util::concurrent::locks::ReentrantLock::isFair ( ) const`

Returns true if this lock has fairness set true.

### Returns

true if this lock has fairness set true

6.666.3.3 `bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread ( ) const`

Queries if this lock is held by the current thread.

This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

```
class X { private: ReentrantLock (p. 3273) lock = new ReentrantLock() (p. 3275); //  
... }
```

```
public: void m() { assert( lock.isHeldByCurrentThread() ); // ... method body } }
```

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

```
class X { private: ReentrantLock (p. 3273) lock = new ReentrantLock() (p. 3275); //
...
public: void m() { assert !lock.isHeldByCurrentThread() (p. 3275); lock.lock(); try {
// ... method body } finally { lock.unlock(); } } }
```

### Returns

true if current thread holds this lock and false otherwise

#### 6.666.3.4 `bool decaf::util::concurrent::locks::ReentrantLock::isLocked ( ) const`

Queries if this lock is held by any thread.

This method is designed for use in monitoring of the system state, not for synchronization control.

### Returns

true if any thread holds this lock and false otherwise

#### 6.666.3.5 `virtual void decaf::util::concurrent::locks::ReentrantLock::lock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [virtual]`

Acquires the lock.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

### Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

Implements `decaf::util::concurrent::locks::Lock` (p. 2454).

**6.666.3.6** `virtual void decaf::util::concurrent::locks::ReentrantLock::lockInterruptibly  
( ) throw ( decaf::lang::exceptions::RuntimeException,  
decaf::lang::exceptions::InterruptedException ) [virtual]`

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

\* The lock is acquired by the current thread; or \* Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

\* has its interrupted status set on entry to this method; or \* is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

### Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
<i>InterruptedException</i>	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implements **decaf::util::concurrent::locks::Lock** (p. 2454).

**6.666.3.7** `virtual Condition* decaf::util::concurrent::locks::ReentrantLock::newCondition  
( ) throw ( decaf::lang::exceptions::RuntimeException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]`

Returns a **Condition** (p. 1282) instance for use with this **Lock** (p. 2452) instance.

The returned **Condition** (p. 1282) instance supports the same usages as do the **Mutex** (p. 2866) Class' methods (wait, notify, and notifyAll).

\* If this lock is not held when any of the **Condition** (p. 1282) waiting or signalling methods are called, then an IllegalMonitorStateException is thrown. \* When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called. \* If a thread is interrupted while waiting then the wait will terminate, an InterruptedException will be thrown, and the thread's interrupted status will be cleared. \* Waiting threads are signaled in FIFO order. \* The ordering of lock reacquisition for

threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair locks favors those threads that have been waiting the longest.

### Exceptions

<i>RuntimeException</i>	if an error occurs while creating the <b>Condition</b> (p. 1282).
<i>UnsupportedOperationException</i>	if this <b>Lock</b> (p. 2452) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 2455).

#### 6.666.3.8 **std::string decaf::util::concurrent::locks::ReentrantLock::toString ( ) const**

Returns a string identifying this lock, as well as its lock state.

The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

### Returns

a string identifying this lock, as well as its lock state

#### 6.666.3.9 **virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock ( long long *time*, const TimeUnit & *unit* ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException ) [virtual]**

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 3279) method. If you want a timed tryLock that does permit barging on a fair lock then combine the timed and un-timed forms together:

```
if (lock.tryLock() || lock.tryLock(timeout, unit) ) { ... }
```

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

\* The lock is acquired by the current thread; or \* Some other thread interrupts the current thread; or \* The specified waiting time elapses

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

\* has its interrupted status set on entry to this method; or \* is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

### Parameters

<i>time</i>	the maximum time to wait for the lock
<i>unit</i>	the time unit of the time argument

### Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

### Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
<i>InterruptedException</i>	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 2456).

**6.666.3.10** `virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [virtual]`

Acquires the lock only if it is not held by another thread at the time of invocation.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 3279) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting for this lock, then use **tryLock(0, TimeUnit.SECONDS** (p. 3930)) which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

### Returns

true if the lock was acquired and false otherwise

**Exceptions**

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

Implements **decaf::util::concurrent::locks::Lock** (p. 2457).

```
6.666.3.11 virtual void decaf::util::concurrent::locks::ReentrantLock::unlock
( ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException ) [virtual]
```

Attempts to release this lock.

If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then `IllegalMonitorStateException` is thrown.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

Implements **decaf::util::concurrent::locks::Lock** (p. 2457).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/locks/ReentrantLock.h`

## 6.667 decaf::util::concurrent::RejectedExecutionException Class Reference

*Clones this exception.*
- virtual ~**RejectedExecutionException** () throw ()

### 6.667.1 Constructor & Destructor Documentation

6.667.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( ) throw () [inline]

Default Constructor.

6.667.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( const Exception & **ex** ) throw () [inline]

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.667.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( const RejectedExecutionException & **ex** ) throw () [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	- The Exception to copy in this new instance.
-----------	---

6.667.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( const std::exception \* **cause** ) throw () [inline]

Constructor.

**Parameters**

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.667.1.5** `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>msg</i>	- The message to report
<i>...</i>	- list of primitives that are formatted into the message

**6.667.1.6** `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( const char * file, const int lineNumber, const std::exception * cause, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>cause</i>	- The exception that was the cause for this one to be thrown.
<i>msg</i>	- The message to report
<i>...</i>	- list of primitives that are formatted into the message

**6.667.1.7** `virtual decaf::util::concurrent::RejectedExecutionException::~~RejectedExecutionException ( ) throw () [inline, virtual]`

**6.667.2 Member Function Documentation**

**6.667.2.1** `virtual RejectedExecutionException* decaf::util::concurrent::RejectedExecutionException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception

as well as the message. All subclasses should override.

### Returns

A new instance this exception type with a copy the current state.

Reimplemented from **decaf::lang::Exception** (p. 1889).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**RejectedExecutionException.h**

## 6.668 decaf::util::concurrent::RejectedExecutionHandler Class Reference

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. ??).

```
#include <src/main/decaf/util/concurrent/RejectedExecutionHandler.h>
```

### Public Member Functions

- virtual **~RejectedExecutionHandler** ()
- virtual void **rejectedExecution** (Runnable \*r, ThreadPoolExecutor \*executer)=0  
throw ( RejectedExecutionException )

*Method that may be invoked by a **ThreadPoolExecutor** (p. ??) when **execute** (p. ??) cannot accept a task.*

### 6.668.1 Detailed Description

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. ??).

### Since

1.0

## 6.668.2 Constructor & Destructor Documentation

6.668.2.1 `virtual decaf::util::concurrent::RejectedExecutionHandler::~~RejectedExecutionHandler ( ) [inline, virtual]`

## 6.668.3 Member Function Documentation

6.668.3.1 `virtual void decaf::util::concurrent::RejectedExecutionHandler::rejectedExecution ( Runnable * r, ThreadPoolExecutor * executor ) throw ( RejectedExecutionException ) [pure virtual]`

Method that may be invoked by a **ThreadPoolExecutor** (p. ??) when **execute** (p. ??) cannot accept a task.

This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p. 1926).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p. 3280), which will be propagated to the caller of **execute** (p. ??).

### Parameters

<i>r</i>	The pointer to the runnable task requested to be executed.
<i>executor</i>	The pointer to the executor attempting to execute this task.

### Exceptions

<b><i>RejectedExecutionException</i></b> (p. 3280)	if there is no remedy.
---	------------------------

The documentation for this class was generated from the following file:

- virtual bool **isRemoveInfo** () const

- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor \*visitor)  
throw ( exceptions::ActiveMQException )

*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

## Static Public Attributes

- static const unsigned char **ID\_REMOVEINFO** = 12

## Protected Attributes

- **Pointer**< **DataStructure** > **objectId**
- long long **lastDeliveredSequenceId**

### 6.669.1 Constructor & Destructor Documentation

6.669.1.1 `activemq::commands::RemoveInfo::RemoveInfo ( )`

6.669.1.2 `virtual activemq::commands::RemoveInfo::~~RemoveInfo ( )` [virtual]

### 6.669.2 Member Function Documentation

6.669.2.1 `virtual RemoveInfo* activemq::commands::RemoveInfo::cloneDataStructure ( )`  
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

#### Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.669.2.2 `virtual void activemq::commands::RemoveInfo::copyDataStructure ( const DataStructure * src )` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

#### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.669.2.3 `virtual bool activemq::commands::RemoveInfo::equals ( const DataStructure * value ) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.669.2.4 `virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSetructure** (p. 1713) type copy.

Implements **activemq::commands::DataSetructure** (p. 1717).

6.669.2.5 `virtual long long activemq::commands::RemoveInfo::getLastDeliveredSequenceld ( ) const [virtual]`

6.669.2.6 `virtual const Pointer<DataSetructure>& activemq::commands::RemoveInfo::getObjectld ( ) const [virtual]`

6.669.2.7 `virtual Pointer<DataSetructure>& activemq::commands::RemoveInfo::getObjectld ( ) [virtual]`

6.669.2.8 `virtual bool activemq::commands::RemoveInfo::isRemoveInfo ( ) const [inline, virtual]`

#### Returns

an answer of true to the **isRemoveInfo()** (p. 3286) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 769).

6.669.2.9 `virtual void activemq::commands::RemoveInfo::setLastDeliveredSequenceld ( long long lastDeliveredSequenceld ) [virtual]`

6.669.2.10 `virtual void activemq::commands::RemoveInfo::setObjectld ( const Pointer<DataSetructure> & objectld ) [virtual]`

6.669.2.11 `virtual std::string activemq::commands::RemoveInfo::toString ( ) const [virtual]`

Returns a string containing the information for this **DataSetructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.669.2.12** `virtual Pointer<Command> activemq::commands::RemoveInfo::visit  
( activemq::state::CommandVisitor * visitor ) throw (  
exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.669.3 Field Documentation

**6.669.3.1** `const unsigned char activemq::commands::RemoveInfo::ID_-  
REMOVEINFO = 12 [static]`

**6.669.3.2** `long long activemq::commands::RemoveInfo::lastDeliveredSequenceId  
[protected]`

**6.669.3.3** `Pointer<DataStructure> activemq::commands::RemoveInfo::objectId  
[protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/RemoveInfo.h`

## 6.670 activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3288).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/RemoveInfoMarsh
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller`:

#### Public Member Functions

- **RemoveInfoMarshaller** ()
- virtual **~RemoveInfoMarshaller** ()
- virtual **commands::DataStructure \* createObject** () const

*Creates a new instance of this marshalable type.*

- virtual void **looseUnmarshal** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **decaf::io::DataInputStream** \*dataIn) throw ( **decaf::io::IOException** )

*Un-marshall an object instance from the data input stream.*

- virtual void **looseMarshal** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **decaf::io::DataOutputStream** \*dataOut) throw ( **decaf::io::IOException** )

*Write a object instance to data output stream.*

### 6.670.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3288). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.670.2 Constructor & Destructor Documentation

6.670.2.1 `activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::RemoveInfoMarshaller ( ) [inline]`

6.670.2.2 `virtual activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::~~RemoveInfoMarshaller ( ) [inline, virtual]`

## 6.670.3 Member Function Documentation

6.670.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.670.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.670.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

**6.670.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

**6.670.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 810).

```
6.670.3.6  virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 811).

```
6.670.3.7  virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 813).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**RemoveInfoMarshaller.h**

## 6.671 activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3292).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/RemoveInfoMarshaller.h>
```

### 6.671.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3292). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.671.2 Constructor & Destructor Documentation

6.671.2.1 **activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::RemoveInfoMarshaller**  
( ) [inline]

6.671.2.2 **virtual activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::~~RemoveInfoMarshaller**  
( ) [inline, virtual]

### 6.671.3 Member Function Documentation

6.671.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.671.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.671.3.3 **virtual void activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

**6.671.3.4** virtual void activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::looseUnmarshal ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

**6.671.3.5** virtual int activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::tightMarshal1 ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.671.3.6  virtual void activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.671.3.7  virtual void activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/**RemoveInfoMarshaller.h**

## 6.672 activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3296).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/RemoveInfoMarshaller.h>
```

### 6.672.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3296). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.672.2 Constructor & Destructor Documentation

6.672.2.1 **activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::RemoveInfoMarshaller**  
 ( ) [inline]

6.672.2.2 **virtual activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::~~RemoveInfoMarshaller**  
 ( ) [inline, virtual]

### 6.672.3 Member Function Documentation

6.672.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::createObject** ( )  
 const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.672.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::getDataStructureType**  
 ( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.672.3.3** virtual void **activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseMarshal**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure**  
\* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut* ) throw ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**  
(p. 772).

**6.672.3.4** virtual void **activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseUnmarshal**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure**  
\* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**  
(p. 774).

```

6.672.3.5 virtual int activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```

6.672.3.6 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

6.672.3.7 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightUnmarshal ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**RemoveInfoMarshaller.h**

## 6.673 activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3300).

### 6.673.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3300). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.673.2 Constructor & Destructor Documentation

6.673.2.1 **activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::RemoveInfoMarshaller**  
( ) [inline]

6.673.2.2 **virtual activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::~~RemoveInfoMarshaller**  
( ) [inline, virtual]

### 6.673.3 Member Function Documentation

6.673.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

## Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.673.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

## Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.673.3.3** `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

**6.673.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

```
6.673.3.5  virtual int activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.673.3.6  virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.674 activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller

### Class Reference

3309

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

**6.673.3.7** virtual void **activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**RemoveInfoMarshaller.h**

## 6.674 activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller

### Class Reference

### 6.674.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3305). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.674.2 Constructor & Destructor Documentation

6.674.2.1 `activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::RemoveInfoMarshaller ( ) [inline]`

6.674.2.2 `virtual activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::~~RemoveInfoMarshaller ( ) [inline, virtual]`

## 6.674.3 Member Function Documentation

6.674.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.674.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.674.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 794).

**6.674.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 795).

**6.674.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

**6.674.3.6** `virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 797).

**6.674.3.7** `virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/RemoveInfoMarshaller.h`

## 6.675 `activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller` Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3309).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/RemoveInfoMarsh
```

### 6.675.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 3309). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.675.2 Constructor & Destructor Documentation

**6.675.2.1** `activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::RemoveInfoMarshaller ( ) [inline]`

**6.675.2.2** `virtual activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::~~RemoveInfoMarshaller ( ) [inline, virtual]`

### 6.675.3 Member Function Documentation

**6.675.3.1** `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.675.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.675.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 780).

**6.675.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 781).

**6.675.3.5** `virtual int activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

**6.675.3.6** virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal2  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure  
 \* *dataStructure*, decaf::io::DataOutputStream \* *dataOut*,  
 utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException )  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

**6.675.3.7** virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightUnmarshal  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream  
 \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i> if an error occurs during the unmarshal.
---

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

### Static Public Attributes

- static const unsigned char **ID\_REMOVESUBSCRIPTIONINFO** = 9

### Protected Attributes

- **Pointer< ConnectionId > connectionId**
- std::string **subscriptionName**
- std::string **clientId**

## 6.676.1 Constructor & Destructor Documentation

6.676.1.1 **activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo** ( )

6.676.1.2 **virtual activemq::commands::RemoveSubscriptionInfo::~~RemoveSubscriptionInfo** ( ) [virtual]

## 6.676.2 Member Function Documentation

6.676.2.1 **virtual RemoveSubscriptionInfo\* activemq::commands::RemoveSubscriptionInfo::cloneDataStructure** ( ) const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

**6.676.2.2** `virtual void activemq::commands::RemoveSubscriptionInfo::copyDataStructure ( const DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

#### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

**6.676.2.3** `virtual bool activemq::commands::RemoveSubscriptionInfo::equals ( const DataStructure * value ) const [virtual]`

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

**6.676.2.4** `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId ( ) const [virtual]`

**6.676.2.5** `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId ( ) [virtual]`

**6.676.2.6** `virtual const Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId ( ) const [virtual]`

**6.676.2.7** `virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId ( ) [virtual]`

**6.676.2.8** `virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataStructure** (p. 1713) type copy.

Implements `activemq::commands::DataStructure` (p. 1717).

6.676.2.9 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName ( ) const [virtual]

6.676.2.10 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName ( ) [virtual]

6.676.2.11 virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo ( ) const [inline, virtual]

#### Returns

an answer of true to the **isRemoveSubscriptionInfo()** (p. 3316) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 769).

6.676.2.12 virtual void activemq::commands::RemoveSubscriptionInfo::setClientId ( const std::string & *clientId* ) [virtual]

6.676.2.13 virtual void activemq::commands::RemoveSubscriptionInfo::setConnectionId ( const Pointer< ConnectionId > & *connectionId* ) [virtual]

6.676.2.14 virtual void activemq::commands::RemoveSubscriptionInfo::setSubscriptionName ( const std::string & *subscriptionName* ) [virtual]

6.676.2.15 virtual std::string activemq::commands::RemoveSubscriptionInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

6.676.2.16 virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit ( activemq::state::CommandVisitor \* *visitor* ) throw ( exceptions::ActiveMQException ) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.676.3 Field Documentation

- 6.676.3.1 **std::string activemq::commands::RemoveSubscriptionInfo::clientId**

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 787).

**6.677.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

6.677 ac-

activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller

Class Reference

3325

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**  
(p. 788).

```
6.677.3.5  virtual int activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**  
(p. 789).

```
6.677.3.6  virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**  
(p. 790).

```
6.677.3.7 virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

## 6.678.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 3322).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.678.2 Constructor & Destructor Documentation

6.678.2.1 **activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::RemoveSubscriptionInfoMarshaller**  
( ) [inline]

6.678.2.2 **virtual activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::~~RemoveSubscriptionInfoMarshaller**  
( ) [inline, virtual]

## 6.678.3 Member Function Documentation

6.678.3.1 **virtual commands::DataStructure\* ac-**  
**activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::createObject**  
( ) const [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.678.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.678.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseMarshal( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

**6.678.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseUnmarshal( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

## 6.678 activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller Class Reference 3329

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

**6.678.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 775).

**6.678.3.6** `virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 776).

**6.678.3.7** `virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

### 6.679.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 3326).  
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.679.2 Constructor & Destructor Documentation

6.679.2.1 `activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::RemoveSubscriptionInfoMarshaller ( ) [inline]`

6.679.2.2 `virtual activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::~~RemoveSubscriptionInfoMarshaller ( ) [inline, virtual]`

## 6.679.3 Member Function Documentation

6.679.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.679.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.679.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

## 6.679 ac- tivismq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller

### Class Reference 3333

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

**6.679.3.4** `virtual void activismq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

**6.679.3.5** `virtual int activismq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 810).

```
6.679.3.6 virtual void activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 811).

```
6.679.3.7 virtual void activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 813).

### 6.680.3 Member Function Documentation

6.680.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::createObject**  
 ( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.680.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::getDataStructureType**  
 ( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.680.3.3 **virtual void activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::looseMarshal**  
 ( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) throw ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

**6.680 activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller**  
**Class Reference** **3337**  
**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

**6.680.3.4** `virtual void activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

**6.680.3.5** `virtual int activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.680.3.6 virtual void activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.680.3.7 virtual void activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**6.681 activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller**  
**Class Reference** **3339**  
**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

The documentation for this class was generated from the following file:

### 6.681.3 Member Function Documentation

- 6.681.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::createObject**  
 ( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.681.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::getDataStructureType**  
 ( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

6.681 ac-

activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller

Class Reference

3341

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

```
6.681.3.3 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

```
6.681.3.4 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

```

6.681.3.5  virtual int activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```

6.681.3.6  virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

6.682 ac-

activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller

Class Reference

3343

6.681.3.7 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream  
\* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

### 6.682.3 Member Function Documentation

6.682.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::createObject**  
( ) const [virtual]

Creates a new instance of this marshalable type.

**6.682 activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller**  
**Class Reference** **3345**  
**Returns**

---

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.682.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.682.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

**6.682.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```
6.682.3.5  virtual int activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

```
6.682.3.6  virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

**6.682.3.7** virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightUnmarshal ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**RemoveSubscriptionInfoMarshaller.h**

**6.683 activemq::commands::ReplayCommand Class Reference**

*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

### Static Public Attributes

- static const unsigned char **ID\_REPLAYCOMMAND** = 65

### Protected Attributes

- int **firstNakNumber**
- int **lastNakNumber**

### 6.683.1 Constructor & Destructor Documentation

6.683.1.1 `activemq::commands::ReplayCommand::ReplayCommand ( )`

6.683.1.2 `virtual activemq::commands::ReplayCommand::~~ReplayCommand ( )`  
[virtual]

### 6.683.2 Member Function Documentation

6.683.2.1 `virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure ( ) const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

#### Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.683.2.2 `virtual void activemq::commands::ReplayCommand::copyDataStructure ( const DataStructure * src )` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

#### Parameters

<code>src</code>	- Source Object
------------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.683.2.3 `virtual bool activemq::commands::ReplayCommand::equals ( const DataStructure * value ) const` [virtual]

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

**6.683.2.4** `virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSet** (p. 1713) type copy.

Implements **activemq::commands::DataSet** (p. 1717).

**6.683.2.5** `virtual int activemq::commands::ReplayCommand::getFirstNakNumber ( ) const [virtual]`

**6.683.2.6** `virtual int activemq::commands::ReplayCommand::getLastNakNumber ( ) const [virtual]`

**6.683.2.7** `virtual void activemq::commands::ReplayCommand::setFirstNakNumber ( int firstNakNumber ) [virtual]`

**6.683.2.8** `virtual void activemq::commands::ReplayCommand::setLastNakNumber ( int lastNakNumber ) [virtual]`

**6.683.2.9** `virtual std::string activemq::commands::ReplayCommand::toString ( ) const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.683.2.10** `virtual Pointer<Command> activemq::commands::ReplayCommand::visit ( activemq::state::CommandVisitor * visitor ) throw ( exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

6.684

**activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller**

 ( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.684.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::getDataStructureType**  
 ( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

6.684

**activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller**

**Class Reference**

**3353**

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.684.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

**6.684.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```

6.684.3.5  virtual int activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

```

6.684.3.6  virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

( ) [inline, virtual]

### 6.685.3 Member Function Documentation

6.685.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::createObject**  
( ) const [virtual]

Creates a new instance of this marshalable type.

6.685

**activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller**

**Class Reference**

3357

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.685.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.685.3.3** `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

**6.685.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

```
6.685.3.5  virtual int activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.685.3.6  virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

6.686

**activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller**

**Class Reference**

**3359**

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

**6.685.3.7** `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ReplayCommandMarshaller.h**

Class Reference

3361

## 6.686.2 Constructor & Destructor Documentation

6.686.2.1 `activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::ReplayCommandMarshaller  
( ) [inline]`

6.686.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::~~ReplayCommandMarshaller  
( ) [inline, virtual]`

## 6.686.3 Member Function Documentation

6.686.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::createObject  
( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.686.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::getDataStructureType  
( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.686.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseMarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (  
decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

**6.686.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

**6.686.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

6.686

activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller

Class Reference

3363

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

**6.686.3.6** virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal2 ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** )  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

**6.686.3.7** virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightUnmarshal ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ReplayCommandMarshaller.h`

### 6.687.3 Member Function Documentation

6.687.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::createObject**  
( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.687.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::getDataStructureType**  
( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.687.3.3 **virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) throw ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 772).

```
6.687.3.4  virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 774).

```
6.687.3.5  virtual int activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

6.687

**activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller**

**Class Reference**

**3367**

**Returns**

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 775).

**6.687.3.6** virtual void **activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal2**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure**  
\* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut*,  
**utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** )  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 776).

**6.687.3.7** virtual void **activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightUnmarshal**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \*  
*dataStructure*, **decaf::io::DataInputStream** \* *dataIn*, **utils::BooleanStream**  
\* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i> if an error occurs during the unmarshal.
---

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

### 6.688.3 Member Function Documentation

6.688.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::createObject**  
( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.688.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::getDataStructureType**  
( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.688.3.3** `virtual void activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 801).

**6.688.3.4** `virtual void activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 802).

6.688

Class Reference

3371

```
6.688.3.5 virtual int activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 803).

```
6.688.3.6 virtual void activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 804).

```
6.688.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

( ) [inline, virtual]

### 6.689.3 Member Function Documentation

6.689.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::createObject**  
( ) const [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.689.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.689.3.3** `virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

**6.689.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

6.689

activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller

Class Reference

3375

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

```
6.689.3.5  virtual int activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

```
6.689.3.6  virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 797).

**6.689.3.7** `virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

*Releases all of the contained resources so that this object will no longer control their lifetimes.*

### Protected Member Functions

- **ResourceLifecycleManager** (const **ResourceLifecycleManager** &)
- **ResourceLifecycleManager** & **operator=** (const **ResourceLifecycleManager** &)

#### 6.694.1 Detailed Description

Manages the lifecycle of a set of CMS resources. A call to `destroy` will close and destroy all of the contained resources in the appropriate manner.

#### 6.694.2 Constructor & Destructor Documentation

6.694.2.1 **activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager** ( const **ResourceLifecycleManager** & ) [`inline`, `protected`]

6.694.2.2 **activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager** ( )

6.694.2.3 **virtual activemq::cmsutil::ResourceLifecycleManager::~~ResourceLifecycleManager** ( ) [`virtual`]

Destructor - calls `destroy`

#### 6.694.3 Member Function Documentation

6.694.3.1 **void activemq::cmsutil::ResourceLifecycleManager::addConnection** ( cms::Connection \* *connection* ) throw ( cms::CMSEException )

Adds a connection so that its life will be managed by this object.

#### Parameters

<i>connection</i>	the object to be managed
-------------------	--------------------------

**6.694.3.2** void activemq::cmsutil::ResourceLifecycleManager::addDestination ( cms::Destination \* *dest* ) throw ( cms::CMSException )

Adds a destination so that its life will be managed by this object.

#### Parameters

<i>dest</i>	the object to be managed
-------------	--------------------------

**6.694.3.3** void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer ( cms::MessageConsumer \* *consumer* ) throw ( cms::CMSException )

Adds a message consumer so that its life will be managed by this object.

#### Parameters

<i>consumer</i>	the object to be managed
-----------------	--------------------------

**6.694.3.4** void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer ( cms::MessageProducer \* *producer* ) throw ( cms::CMSException )

Adds a message producer so that its life will be managed by this object.

#### Parameters

<i>producer</i>	the object to be managed
-----------------	--------------------------

**6.694.3.5** void activemq::cmsutil::ResourceLifecycleManager::addSession ( cms::Session \* *session* ) throw ( cms::CMSException )

Adds a session so that its life will be managed by this object.

#### Parameters

<i>session</i>	the object to be managed
----------------	--------------------------

**6.694.3.6** void activemq::cmsutil::ResourceLifecycleManager::destroy ( ) throw ( cms::CMSException )

Closes and destroys the contained CMS resources.

#### Exceptions

<i>cms::CMSException</i> (p. 1190)	thrown if an error occurs.
---------------------------------------	----------------------------

6.694.3.7 **ResourceLifecycleManager& activemq::cmsutil::ResourceLifecycleManager::operator= ( const ResourceLifecycleManager & )** [inline, protected]

6.694.3.8 **void activemq::cmsutil::ResourceLifecycleManager::releaseAll ( )**

Releases all of the contained resources so that this object will no longer control their lifetimes.

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**ResourceLifecycleManager.h**

## 6.695 activemq::commands::Response Class Reference

throw ( exceptions::ActiveMQException )

*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

### Static Public Attributes

- static const unsigned char **ID\_RESPONSE** = 30

### Protected Attributes

- int **correlationId**

## 6.695.1 Constructor & Destructor Documentation

6.695.1.1 **activemq::commands::Response::Response** ( )

6.695.1.2 **virtual activemq::commands::Response::~~Response** ( ) [virtual]

## 6.695.2 Member Function Documentation

6.695.2.1 **virtual Response\*** **activemq::commands::Response::cloneDataStructure** ( ) const  
[virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1573), **activemq::commands::DataResponse** (p. 1633), **activemq::commands::ExceptionResponse** (p. 1896), and **activemq::commands::IntegerResponse** (p. 2161).

6.695.2.2 **virtual void** **activemq::commands::Response::copyDataStructure** ( const  
**DataStructure \* src** ) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1573), **activemq::commands::DataResponse** (p. 1633), **activemq::commands::ExceptionResponse** (p. 1896), and **activemq::commands::IntegerResponse** (p. 2161).

**6.695.2.3** `virtual bool activemq::commands::Response::equals ( const DataStructure *  
value ) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1573), **activemq::commands::DataResponse** (p. 1633), **activemq::commands::ExceptionResponse** (p. 1896), and **activemq::commands::IntegerResponse** (p. 2161).

**6.695.2.4** `virtual int activemq::commands::Response::getCorrelationId ( ) const`  
[virtual]

**6.695.2.5** `virtual unsigned char activemq::commands::Response::getDataStructureType ( )  
const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1574), **activemq::commands::DataResponse** (p. 1634), **activemq::commands::ExceptionResponse** (p. 1897), and **activemq::commands::IntegerResponse** (p. 2162).

**6.695.2.6** `virtual bool activemq::commands::Response::isResponse ( ) const` [inline,  
virtual]

#### Returns

an answer of true to the **isResponse()** (p. 3381) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 769).

**6.695.2.7** `virtual void activemq::commands::Response::setCorrelationId ( int correlationId )`  
[virtual]

**6.695.2.8** `virtual std::string activemq::commands::Response::toString ( ) const`  
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1574), **activemq::commands::DataResponse** (p. 1634), **activemq::commands::ExceptionResponse** (p. 1897), and **activemq::commands::IntegerResponse** (p. 2162).

**6.695.2.9** `virtual Pointer<Command> activemq::commands::Response::visit`  
`( activemq::state::CommandVisitor * visitor ) throw (`  
`exceptions::ActiveMQException )` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.695.3 Field Documentation

**6.695.3.1** `int activemq::commands::Response::correlationId` [protected]

**6.695.3.2** `const unsigned char activemq::commands::Response::ID_RESPONSE = 30`  
[static]

The documentation for this class was generated from the following file:

## 6.696 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

```
#include <src/main/activemq/transport/mock/ResponseBuilder.h>
```

Inheritance diagram for activemq::transport::mock::ResponseBuilder:

## Public Member Functions

- virtual **~ResponseBuilder** ()
- virtual **Pointer< Response > buildResponse** (const **Pointer< Command >** &command)=0  
*Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.*
- virtual void **buildIncomingCommands** (const **Pointer< Command >** &command, **decaf::util::StlQueue< Pointer< Command > >** &queue)=0  
*When called the **ResponseBuilder** (p. 3382) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

### 6.696.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

### 6.696.2 Constructor & Destructor Documentation

6.696.2.1 virtual activemq::transport::mock::ResponseBuilder::~ResponseBuilder ( )  
 [inline, virtual]

### 6.696.3 Member Function Documentation

6.696.3.1 virtual void activemq::transport::mock::ResponseBuilder::buildIncomingCommands ( const **Pointer< Command >** & command, **decaf::util::StlQueue< Pointer< Command > >** & queue ) [pure virtual]

When called the **ResponseBuilder** (p. 3382) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

#### Parameters

<i>command</i>	- The Command being sent to the Broker.
<i>queue</i>	- Queue of Command sent back from the broker.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2990).

**6.696.3.2** virtual **Pointer<Response>** **activemq::transport::mock::ResponseBuilder::buildResponse** (  
**const Pointer< Command > &command** ) [pure virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

#### Parameters

<i>command</i>	- The command to build a response for
----------------	---------------------------------------

#### Returns

A Response object pointer, or NULL if no response.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2991).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**ResponseBuilder.h**

## 6.697 **activemq::transport::correlator::ResponseCorrelator** Class Reference

This type of transport filter is responsible for correlating asynchronous responses with requests.

```
#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>
```

Inheritance diagram for **activemq::transport::correlator::ResponseCorrelator**:

#### Public Member Functions

- **ResponseCorrelator** (const **Pointer< Transport > &next**)

*Constructor.*

- virtual **~ResponseCorrelator** ()
- virtual void **oneway** (const **Pointer< Command > &command**) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )

*Sends a one-way command.*

- virtual **Pointer< Response > request** (const **Pointer< Command > &command**) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )

*Sends the given request to the server and waits for the response.*

## 6.697 activemq::transport::correlator::ResponseCorrelator Class Reference 3389

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )  
*Sends the given request to the server and waits for the response.*
- virtual void **onCommand** (const **Pointer**< **Command** > &command)  
*This is called in the context of the nested transport's reading thread.*
- virtual void **start** () throw ( decaf::io::IOException )  
*Starts this transport object and creates the thread for polling on the input stream for commands.*
- virtual void **close** () throw ( decaf::io::IOException )  
*Stops the polling thread and closes the streams.*
- virtual void **onTransportException** (**Transport** \*source, const **decaf::lang::Exception** &ex)  
*Event handler for an exception from a command transport.*

### 6.697.1 Detailed Description

This type of transport filter is responsible for correlating asynchronous responses with requests. Non-response messages are simply sent directly to the CommandListener. It owns the transport that it

### 6.697.2 Constructor & Destructor Documentation

#### 6.697.2.1 activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator ( const **Pointer**< **Transport** > & next )

Constructor.

#### Parameters

<i>next</i>	the next transport in the chain
-------------	---------------------------------

**6.697.2.2** `virtual activemq::transport::correlator::ResponseCorrelator::~~ResponseCorrelator ( ) [virtual]`

### 6.697.3 Member Function Documentation

**6.697.3.1** `virtual void activemq::transport::correlator::ResponseCorrelator::close ( ) throw ( decaf::io::IOException ) [virtual]`

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

#### Exceptions

<i>IOException</i>	if errors occur.
--------------------	------------------

Reimplemented from `activemq::transport::TransportFilter` (p. 4007).

**6.697.3.2** `virtual void activemq::transport::correlator::ResponseCorrelator::onCommand ( const Pointer< Command > & command ) [virtual]`

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

#### Parameters

<i>command</i>	the received from the nested transport.
----------------	---

Reimplemented from `activemq::transport::TransportFilter` (p. 4009).

**6.697.3.3** `virtual void activemq::transport::correlator::ResponseCorrelator::oneway ( const Pointer< Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

#### Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

#### Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

## 6.697 activemq::transport::correlator::ResponseCorrelator Class Reference 3391

Reimplemented from **activemq::transport::TransportFilter** (p. 4010).

**6.697.3.4** `virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException ( Transport * source, const decaf::lang::Exception & ex ) [virtual]`

Event handler for an exception from a command transport.

### Parameters

<i>source</i>	The source of the exception
<i>ex</i>	The exception.

**6.697.3.5** `virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request ( const Pointer< Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]`

Sends the given request to the server and waits for the response.

### Parameters

<i>command</i>	The request to send.
----------------	----------------------

### Returns

the response from the server.

### Exceptions

<i>IOException</i>	if an error occurs with the request.
--------------------	--------------------------------------

Reimplemented from **activemq::transport::TransportFilter** (p. 4011).

**6.697.3.6** `virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request ( const Pointer< Command > & command, unsigned int timeout ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]`

Sends the given request to the server and waits for the response.

### Parameters

<i>command</i>	The request to send.
<i>timeout</i>	The time to wait for a response.

**Returns**

the response from the server.

**Exceptions**

<i>IOException</i>	if an error occurs with the request.
--------------------	--------------------------------------

Reimplemented from **activemq::transport::TransportFilter** (p. 4011).

**6.697.3.7** `virtual void activemq::transport::correlator::ResponseCorrelator::start ( ) throw ( decaf::io::IOException )` [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

**Exceptions**

<i>IOException</i>	if an error occurs or if this transport has already been closed.
--------------------	--

Reimplemented from **activemq::transport::TransportFilter** (p. 4012).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**ResponseCorrelator.h**

## 6.698 **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3388).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ResponseMarshal
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller**:

**Public Member Functions**

- **ResponseMarshaller** ()
- virtual **~ResponseMarshaller** ()
- virtual **commands::DataStructure \* createObject** () const  
*Creates a new instance of this marshalable type.*
- virtual unsigned char **getDataStructureType** () const

*Get the Data Structure Type that identifies this Marshaler.*

- virtual void **tightUnmarshal** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **decaf::io::DataInputStream** \*dataIn, **utils::BooleanStream** \*bs) throw ( decaf::io::IOException )

*Un-marshall an object instance from the data input stream.*

- virtual int **tightMarshal1** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **utils::BooleanStream** \*bs) throw ( decaf::io::IOException )

*Write the booleans that this object uses to a BooleanStream.*

- virtual void **tightMarshal2** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **decaf::io::DataOutputStream** \*dataOut, **utils::BooleanStream** \*bs) throw ( decaf::io::IOException )

*Write a object instance to data output stream.*

- virtual void **looseUnmarshal** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **decaf::io::DataInputStream** \*dataIn) throw ( decaf::io::IOException )

*Un-marshall an object instance from the data input stream.*

- virtual void **looseMarshal** (**OpenWireFormat** \*wireFormat, **commands::DataStructure** \*dataStructure, **decaf::io::DataOutputStream** \*dataOut) throw ( decaf::io::IOException )

*Write a object instance to data output stream.*

### 6.698.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p.3388). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.698.2 Constructor & Destructor Documentation

6.698.2.1 `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::ResponseMarshaller ( ) [inline]`

6.698.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::~~ResponseMarshaller ( ) [inline, virtual]`

## 6.698.3 Member Function Documentation

6.698.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1584), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1653), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1916), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 2177).

6.698.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1585), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1653), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1916), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 2177).

6.698.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

## 6.698 activemq::wireformat::openwire::marshal::v4::ResponseMarshaller Class Reference 3395

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1585), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1654), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1917), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 2177).

```
6.698.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseUnmarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
  * dataStructure, decaf::io::DataInputStream * dataIn ) throw (  
  decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1585), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1654), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1917), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 2178).

6.698.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1586), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1654), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1917), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 2178).

6.698.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.699 `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` Class Reference 3397

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1586), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1655), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1918), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 2179).

```
6.698.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 784).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1587), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1655), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1918), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 2179).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/ResponseMarshaller.h`

## 6.699 `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` Class Reference

### 6.699.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3393). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.699.2 Constructor & Destructor Documentation

6.699.2.1 `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::ResponseMarshaller  
( ) [inline]`

6.699.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::~~ResponseMarshaller  
( ) [inline, virtual]`

## 6.699.3 Member Function Documentation

6.699.3.1 `virtual commands::DataStructure* ac-  
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::createObject ( )  
const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1576), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1644), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1903), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2168).

6.699.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::getDataStructureType  
( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1576), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1645), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1903), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2168).

6.699.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseMarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (  
decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1576), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1645), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1904), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2169).

```
6.699.3.4  virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataInputStream * dataIn ) throw (
  decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1577), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1645), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1904), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2169).

## 6.699 activemq::wireformat::openwire::marshal::v2::ResponseMarshaller Class Reference 3401

**6.699.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 810).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1577), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1646), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1905), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2169).

**6.699.3.6** `virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 811).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1578), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1646), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1905), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2170).

**6.699.3.7** `virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 813).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1578), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1647), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1906), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 2170).

## 6.700.3 Member Function Documentation

6.700.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1593), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1636), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1912), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 2185).

6.700.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1593), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1636), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1912), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 2186).

6.700.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

## 6.700 activemq::wireformat::openwire::marshal::v5::ResponseMarshaller Class Reference 3405

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller** (p. 1594), **activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller** (p. 1636), **activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller** (p. 1912), and **activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller** (p. 2186).

```
6.700.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataInputStream * dataIn ) throw (
 decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller** (p. 1594), **activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller** (p. 1637), **activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller** (p. 1913), and **activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller** (p. 2186).

```

6.700.3.5  virtual int activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1594), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1637), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1913), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 2187).

```

6.700.3.6  virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.701 activemq::wireformat::openwire::marshal::v3::ResponseMarshaller Class Reference 3407

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1595), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1638), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1914), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 2187).

```
6.700.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 799).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1595), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1638), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1914), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 2188).

## 6.701.3 Member Function Documentation

**6.701.3.1** `virtual commands::DataStructure* ac-  
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::createObject ( )  
const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1580), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1649), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1907), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2172).

**6.701.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::getDataStructureType  
( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1580), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1649), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1908), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2173).

**6.701.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseMarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (  
decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 772).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1581), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1649), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1908), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2173).

```
6.701.3.4  virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataInputStream * dataIn ) throw (
  decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 774).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1581), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1650), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1908), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2173).

## 6.701 activemq::wireformat::openwire::marshal::v3::ResponseMarshaller Class Reference 3411

**6.701.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1581), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1650), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1909), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2174).

**6.701.3.6** `virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1582), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1651), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1909), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2174).

**6.701.3.7** `virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 777).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1582), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1651), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1910), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 2175).

The documentation for this class was generated from the following file:

### 6.702.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3408). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.702.2 Constructor & Destructor Documentation

6.702.2.1 `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::ResponseMarshaller ( ) [inline]`

6.702.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::~~ResponseMarshaller ( ) [inline, virtual]`

## 6.702.3 Member Function Documentation

6.702.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1589), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1657), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1920), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2181).

6.702.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1589), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1658), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1921), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2181).

6.702.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

## 6.702 activemq::wireformat::openwire::marshal::v1::ResponseMarshaller Class Reference 3415

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1589), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1658), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1921), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 2182).

```
6.702.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1590), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1658), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1921), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 2182).

6.702.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 789).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1590), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1659), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1922), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2182).

6.702.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.703 `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` Class Reference 3417

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1591), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1659), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1922), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2183).

```
6.702.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
  * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 792).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1591), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1660), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1923), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 2183).

### 6.703.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3413). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.703.2 Constructor & Destructor Documentation

**6.703.2.1** `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::ResponseMarshaller  
( ) [inline]`

**6.703.2.2** `virtual activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::~~ResponseMarshaller  
( ) [inline, virtual]`

## 6.703.3 Member Function Documentation

**6.703.3.1** `virtual commands::DataStructure* ac-  
tivemq::wireformat::openwire::marshal::v6::ResponseMarshaller::createObject ( )  
const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1597), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1640), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1899), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2164).

**6.703.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::getDataStructureType  
( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1598), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1640), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1899), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2164).

**6.703.3.3** `virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::looseMarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (  
decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 801).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1598), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1641), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1899), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2164).

```
6.703.3.4 virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 802).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1598), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1641), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1900), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2165).

## 6.703 activemq::wireformat::openwire::marshal::v6::ResponseMarshaller Class Reference 3421

**6.703.3.5** `virtual int activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1599), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1642), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1900), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2165).

**6.703.3.6** `virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1599), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1642), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1901), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2166).

**6.703.3.7** `virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 806).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1600), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1643), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1901), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 2166).

The documentation for this class was generated from the following file:

## 6.705 decaf::lang::Runtime Class Reference

```
#include <src/main/decaf/lang/Runtime.h>
```

Inheritance diagram for decaf::lang::Runtime:

## Public Member Functions

- virtual **~Runtime** ()

## Static Public Member Functions

- static **Runtime \* getRuntime** ()

*Gets the single instance of the Decaf **Runtime** (p. 3419) for this Process.*

- static void **initializeRuntime** (int argc, char \*\*argv)

*Initialize the Decaf Library passing it the args that were passed to the application at startup.*

- static void **initializeRuntime** ()

*Initialize the Decaf Library.*

- static void **shutdownRuntime** ()

*Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.*

## 6.705.1 Constructor & Destructor Documentation

6.705.1.1 virtual decaf::lang::Runtime::~~Runtime ( ) [inline, virtual]

## 6.705.2 Member Function Documentation

6.705.2.1 static Runtime\* decaf::lang::Runtime::getRuntime ( ) [static]

Gets the single instance of the Decaf **Runtime** (p. 3419) for this Process.

### Returns

pointer to the single Decaf **Runtime** (p. 3419) instance that exists for this process

6.705.2.2 static void decaf::lang::Runtime::initializeRuntime ( int argc, char \*\* argv )  
[static]

Initialize the Decaf Library passing it the args that were passed to the application at startup.

### Parameters

<i>argc</i>	- The number of args passed
<i>argv</i>	- Array of char* values passed to the Process on start.

### Exceptions

<i>runtime_error</i>	if the library is already initialized or an error occurs during initialization.
----------------------	---

**6.705.2.3 static void decaf::lang::Runtime::initializeRuntime ( ) [static]**

Initialize the Decaf Library.

**Exceptions**

<i>runtime_error</i>	if the library is already initialized or an error occurs during initialization.
----------------------	---

**6.705.2.4 static void decaf::lang::Runtime::shutdownRuntime ( ) [static]**

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

**Exceptions**

<i>runtime_error</i>	if the library has not already been initialized or an error occurs during shutdown.
----------------------	---

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Runtime.h**

**6.706 decaf::lang::exceptions::RuntimeException Class Reference**

```
#include <src/main/decaf/lang/exceptions/RuntimeException.h>
```

Inheritance diagram for decaf::lang::exceptions::RuntimeException:

**Public Member Functions**

- **RuntimeException** () throw ()  
*Default Constructor.*
- **RuntimeException** (const **Exception** &ex) throw ()  
*Conversion Constructor from some other ActiveMQException.*
- **RuntimeException** (const **RuntimeException** &ex) throw ()  
*Copy Constructor.*
- **RuntimeException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*

- **RuntimeException** (const std::exception \***cause**) throw ()  
*Constructor.*
- **RuntimeException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- virtual **RuntimeException** \* **clone** () const  
*Clones this exception.*
- virtual ~**RuntimeException** () throw ()

### 6.706.1 Constructor & Destructor Documentation

6.706.1.1 **decaf::lang::exceptions::RuntimeException::RuntimeException ( ) throw ()**  
[inline]

Default Constructor.

6.706.1.2 **decaf::lang::exceptions::RuntimeException::RuntimeException ( const Exception & ex ) throw ()** [inline]

Conversion Constructor from some other ActiveMQException.

#### Parameters

<i>ex</i>	The <b>Exception</b> (p. 1886) whose data is to be copied into this one.
-----------	--

6.706.1.3 **decaf::lang::exceptions::RuntimeException::RuntimeException ( const RuntimeException & ex ) throw ()** [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	The <b>Exception</b> (p. 1886) whose data is to be copied into this one.
-----------	--

6.706.1.4 **decaf::lang::exceptions::RuntimeException::RuntimeException ( const char \* file, const int lineNumber, const std::exception \* cause, const char \* msg, ... ) throw ()**  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.706.1.5** decaf::lang::exceptions::RuntimeException::RuntimeException ( const std::exception \* *cause* ) throw () [inline]

Constructor.

**Parameters**

<i>cause</i>	<b>Pointer</b> (p. 3032) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	---

**6.706.1.6** decaf::lang::exceptions::RuntimeException::RuntimeException ( const char \* *file*, const int *lineNumber*, const char \* *msg*, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.706.1.7** virtual decaf::lang::exceptions::RuntimeException::~~RuntimeException ( ) throw () [inline, virtual]

**6.706.2 Member Function Documentation**

**6.706.2.1** virtual RuntimeException\* decaf::lang::exceptions::RuntimeException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

**Returns**

an new **Exception** (p. 1886) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1889).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**RuntimeException.h**

## 6.707 decaf::security::SecureRandom Class Reference

```
#include <src/main/decaf/security/SecureRandom.h>
```

Inheritance diagram for decaf::security::SecureRandom:

### Public Member Functions

- **SecureRandom** ()  
*Creates a new instance of a secure random number generator that implements the default random number algorithm.*
- **SecureRandom** (const std::vector< unsigned char > &seed)  
*Creates a new instance of a secure random number generator that implements the default random number algorithm.*
- **SecureRandom** (const unsigned char \*seed, int size)  
*Creates a new instance of a secure random number generator that implements the default random number algorithm.*
- virtual ~**SecureRandom** ()
- virtual void **nextBytes** (std::vector< unsigned char > &buf)  
*Modifies the byte array by a random sequence of bytes generated by this random number generator.*

#### Parameters

buf	non-null array to contain the new random bytes
-----	--

#### See also

*next* (p. 3247)

- virtual void **nextBytes** (unsigned char \*buf, int size)  
*Modifies the byte array by a random sequence of bytes generated by this random number generator.*

#### Parameters

buf	non-null array to contain the new random bytes
-----	--

#### See also

*next* (p. 3247)

*Exceptions*

NullPointerException	if <i>buff</i> is <i>NULL</i>
IllegalArgumentException	if <i>size</i> is <i>negative</i>

- virtual void **setSeed** (unsigned long long seed)

*Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.*

*Parameters*

seed	<i>the seed that alters the state of the random number generator</i>
------	--

*See also*

*next* (p. 3247)

*Random()* (p. 3247)

*#Random(long)*

- virtual void **setSeed** (const std::vector< unsigned char > &seed)

*Supplements or sets the seed of this secure random number generator; calls to this method never reduces randomness.*

- virtual void **setSeed** (const unsigned char \*seed, int size)

*Supplements or sets the seed of this secure random number generator; calls to this method never reduces randomness.*

**Protected Member Functions**

- virtual int **next** (int bits)

*Answers a pseudo-random uniformly distributed int value of the number of bits specified by the argument bits as described by Donald E.*

*Knuth in The Art of Computer Programming, Volume 2: Seminumerical Algorithms, section 3.2.1.*

*Returns*

*int a pseudo-random generated int number*

*Parameters*

bits	<i>number of bits of the returned value</i>
------	---

*See also*

*nextBytes* (p. 3249)

### 6.707.1 Detailed Description

Since

1.0

### 6.707.2 Constructor & Destructor Documentation

#### 6.707.2.1 `decaf::security::SecureRandom::SecureRandom ( )`

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 3424) instance that is created with this constructor is unseeded and can be seeded by calling the `setSeed` method. Calls to `nextBytes` on an unseeded **SecureRandom** (p. 3424) result in the object seeding itself.

#### 6.707.2.2 `decaf::security::SecureRandom::SecureRandom ( const std::vector< unsigned char > & seed )`

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 3424) instance created by this constructor is seeded using the passed byte array.

#### Parameters

<i>seed</i>	The seed bytes to use to seed this secure random number generator.
-------------	--

#### 6.707.2.3 `decaf::security::SecureRandom::SecureRandom ( const unsigned char * seed, int size )`

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 3424) instance created by this constructor is seeded using the passed byte array.

#### Parameters

<i>seed</i>	The seed bytes to use to seed this secure random number generator.
<i>size</i>	The number of bytes in the seed buffer.

#### Exceptions

<i>NullPointerException</i>	if the seed buffer is NULL.
<i>IllegalArgumentException</i>	if the size value is negative.

6.707.2.4 virtual decaf::security::SecureRandom::~SecureRandom ( ) [virtual]

### 6.707.3 Member Function Documentation

6.707.3.1 virtual int decaf::security::SecureRandom::next ( int *bits* ) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

#### Returns

`int` a pseudo-random generated `int` number

#### Parameters

<i>bits</i>	number of bits of the returned value
-------------	--------------------------------------

#### See also

**nextBytes** (p. 3249)  
**nextDouble** (p. 3249)  
**nextFloat** (p. 3249)  
**nextInt()** (p. 3250)  
**nextInt(int)** (p. 3250)  
**nextGaussian** (p. 3249)  
**nextLong** (p. 3250)

Reimplemented from **decaf::util::Random** (p. 3247).

6.707.3.2 virtual void decaf::security::SecureRandom::nextBytes ( unsigned char \* *buf*, int *size* ) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

#### Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

#### See also

**next** (p. 3247)

#### Exceptions

<i>NullPointerException</i>	if <i>buff</i> is NULL
-----------------------------	------------------------

<i>IllegalArgumentException</i>	if size is negative
---------------------------------	---------------------

Reimplemented from **decaf::util::Random** (p. 3248).

**6.707.3.3** `virtual void decaf::security::SecureRandom::nextBytes ( std::vector< unsigned char > & buf ) [virtual]`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

#### Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

#### See also

**next** (p. 3247)

Reimplemented from **decaf::util::Random** (p. 3249).

**6.707.3.4** `virtual void decaf::security::SecureRandom::setSeed ( const std::vector< unsigned char > & seed ) [virtual]`

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

#### Parameters

<i>seed</i>	A vector of bytes that is used update the seed of the RNG.
-------------	--

**6.707.3.5** `virtual void decaf::security::SecureRandom::setSeed ( const unsigned char * seed, int size ) [virtual]`

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

#### Parameters

<i>seed</i>	The seed bytes to use to seed this secure random number generator.
<i>size</i>	The number of bytes in the seed buffer.

#### Exceptions

<i>NullPointerException</i>	if the seed buffer is NULL.
<i>IllegalArgumentEx-ception</i>	if the size value is negative.

**6.707.3.6** virtual void decaf::security::SecureRandom::setSeed ( unsigned long long *seed* )  
[virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

#### Parameters

<i>seed</i>	the seed that alters the state of the random number generator
-------------	---

#### See also

**next** (p. 3247)  
**Random()** (p. 3247)  
**#Random(long)**

Reimplemented from **decaf::util::Random** (p. 3251).

The documentation for this class was generated from the following file:

*Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.*

### 6.708.1 Detailed Description

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources. Secure Random Number Generator for Windows based platforms that attempts to obtain secure bytes with high entropy from known sources.

If the platform does not have a source of secure bytes then the platform random number generator is used if one exists otherwise the Decaf RNG is used as a last resort.

Since

1.0

### 6.708.2 Constructor & Destructor Documentation

6.708.2.1 **decaf::internal::security::SecureRandomImpl::SecureRandomImpl ( )**

6.708.2.2 **virtual decaf::internal::security::SecureRandomImpl::~~SecureRandomImpl ( )**  
 [virtual]

6.708.2.3 **decaf::internal::security::SecureRandomImpl::SecureRandomImpl ( )**

6.708.2.4 **virtual decaf::internal::security::SecureRandomImpl::~~SecureRandomImpl ( )**  
 [virtual]

### 6.708.3 Member Function Documentation

6.708.3.1 **virtual unsigned char\* decaf::internal::security::SecureRandomImpl::providerGenerateSeed ( int numBytes )** [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

#### Parameters

<i>numBytes</i>	The number of bytes that should be generated for the new seed array.
-----------------	--

Implements **decaf::security::SecureRandomSpi** (p. 3433).

**6.708.3.2** `virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed ( int numBytes ) [virtual]`

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

#### Parameters

<i>numBytes</i>	The number of bytes that should be generated for the new seed array.
-----------------	--

Implements **decaf::security::SecureRandomSpi** (p. 3433).

**6.708.3.3** `virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes ( unsigned char * bytes, int numBytes ) [virtual]`

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

#### Parameters

<i>bytes</i>	The array that will be filled with random bytes equal to size.
<i>numBytes</i>	The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 3434).

**6.708.3.4** `virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes ( unsigned char * bytes, int numBytes ) [virtual]`

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

#### Parameters

<i>bytes</i>	The array that will be filled with random bytes equal to size.
<i>numBytes</i>	The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 3434).

**6.708.3.5** `virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed ( const unsigned char * seed, int size ) [virtual]`

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

#### Parameters

<i>seed</i>	The array of bytes used to update the generators seed.
<i>size</i>	The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 3434).

**6.708.3.6** `virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed ( const unsigned char * seed, int size ) [virtual]`

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

#### Parameters

<i>seed</i>	The array of bytes used to update the generators seed.
<i>size</i>	The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 3434).

The documentation for this class was generated from the following files:

- src/main/decaf/internal/security/unix/SecureRandomImpl.h
- src/main/decaf/internal/security/windows/SecureRandomImpl.h

## 6.709 decaf::security::SecureRandomSpi Class Reference

Interface class used by Security Service Providers to implement a source of secure random bytes.

```
#include <src/main/decaf/security/SecureRandomSpi.h>
```

Inheritance diagram for decaf::security::SecureRandomSpi:

### Public Member Functions

### 6.709.1 Detailed Description

Interface class used by Security Service Providers to implement a source of secure random bytes.

Since

1.0

### 6.709.2 Constructor & Destructor Documentation

6.709.2.1 `decaf::security::SecureRandomSpi::SecureRandomSpi()`

6.709.2.2 `virtual decaf::security::SecureRandomSpi::~~SecureRandomSpi()` [virtual]

### 6.709.3 Member Function Documentation

6.709.3.1 `virtual unsigned char* decaf::security::SecureRandomSpi::providerGenerateSeed (int numBytes)` [pure virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

#### Parameters

<i>numBytes</i>	The number of bytes that should be generated for the new seed array.
-----------------	--

Implemented in `decaf::internal::security::SecureRandomImpl` (p. 3431), and `decaf::internal::security::SecureRandomImpl` (p. 3431).

**6.709.3.2** `virtual void decaf::security::SecureRandomSpi::providerNextBytes ( unsigned char * bytes, int numBytes )` [pure virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

#### Parameters

<i>bytes</i>	The array that will be filled with random bytes equal to size.
<i>numBytes</i>	The number of bytes to generate and write into the bytes array.

Implemented in `decaf::internal::security::SecureRandomImpl` (p. 3431), and `decaf::internal::security::SecureRandomImpl` (p. 3431).

**6.709.3.3** `virtual void decaf::security::SecureRandomSpi::providerSetSeed ( const unsigned char * seed, int size )` [pure virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

#### Parameters

<i>seed</i>	The array of bytes used to update the generators seed.
<i>size</i>	The size of the passed byte array.

Implemented in `decaf::internal::security::SecureRandomImpl` (p. 3432), and `decaf::internal::security::SecureRandomImpl` (p. 3432).

*Acquires and returns all permits that are immediately available.*
- **bool isFair () const**
- **std::string toString () const**  
*Returns a string identifying this semaphore, as well as its state.*

### 6.710.1 Detailed Description

A counting semaphore. Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 3438) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 3441) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 3434) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

```
class Pool { private:
```

```
static const int MAX_AVAILABLE = 100; Semaphore (p. 3434) available;
```

```
std::vector<std::string> items; std::vector<bool> used;
```

```
Mutex (p. 2866) lock;
```

```
public:
```

```
Pool() : available( MAX_AVAILABLE, true ) { used.resize( MAX_AVAILABLE );  
items.resize( MAX_AVAILABLE ); }
```

```
std::string getItem() throws InterruptedException { available.acquire(); return getNextAvailableItem(); }
```

```
void putItem( std::string x ) { if( markAsUnused(x) ) { available.release(); } }
```

```
std::string getNextAvailableItem() {
```

```
synchronized( &lock ) (p. 4713) { for( int i = 0; i < MAX_AVAILABLE; ++i ) { if(  
!used[i] ) { used[i] = true; return items[i]; } }
```

```
return std::string(); // not reached }
```

```
bool markAsUnused( const std::string& item ) { synchronized( &lock ) (p. 4713) {  
for( int i = 0; i < MAX_AVAILABLE; ++i ) { if( item == items[i] ) { if( used[i] ) {  
used[i] = false; return true; } else return false; } } } return false; } };
```

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back to the pool and a permit is returned to the semaphore, allowing

another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 3438) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this way, the binary semaphore has the property (unlike many **Lock** (p. 2450) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 3438) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific internal points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinite postponement when these methods are used without fairness set true.

#### Since

1.0

### 6.710.2 Constructor & Destructor Documentation

#### 6.710.2.1 decaf::util::concurrent::Semaphore::Semaphore ( int *permits* )

Creates a **Semaphore** (p. 3434) with the given number of permits and nonfair fairness setting.

#### Parameters

<i>permits</i>	the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.
----------------	---

### 6.710.2.2 `decaf::util::concurrent::Semaphore::Semaphore ( int permits, bool fair )`

Creates a **Semaphore** (p. 3434) with the given number of permits and the given fairness setting.

#### Parameters

<i>permits</i>	the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.
<i>fair</i>	true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

### 6.710.2.3 `virtual decaf::util::concurrent::Semaphore::~Semaphore ( ) [virtual]`

## 6.710.3 Member Function Documentation

### 6.710.3.1 `void decaf::util::concurrent::Semaphore::acquire ( ) throw ( decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException )`

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

\* Some other thread invokes the **release()** (p. 3441) method for this semaphore and the current thread is next to be assigned a permit; or \* Some other thread interrupts the current thread.

If the current thread:

\* has its interrupted status set on entry to this method; or \* is interrupted while waiting for a permit,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

#### Exceptions

<i>InterruptedException</i>	- if the current thread is interrupted.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).

**6.710.3.2** `void decaf::util::concurrent::Semaphore::acquire ( int permits )  
 throw ( decaf::lang::exceptions::InterruptedException,  
 decaf::lang::exceptions::IllegalArgumentException,  
 decaf::lang::exceptions::RuntimeException )`

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

\* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or \* Some other thread interrupts the current thread.

If the current thread:

\* has its interrupted status set on entry to this method; or \* is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 3441).

#### Parameters

<i>permits</i>	the number of permits to acquire.
----------------	-----------------------------------

#### Exceptions

<i>InterruptedException</i>	if the current thread is interrupted.
<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).

**6.710.3.3** `void decaf::util::concurrent::Semaphore::acquireUninterruptibly ( ) throw ( decaf::lang::exceptions::RuntimeException )`

Acquires a permit from this semaphore, blocking until one is available.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes the **release()** (p. 3441) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the

time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

### Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).
-------------------------	---

**6.710.3.4** `void decaf::util::concurrent::Semaphore::acquireUninterruptibly ( int permits ) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException )`

Acquires the given number of permits from this semaphore, blocking until all are available.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

### Parameters

<i>permits</i>	the number of permits to acquire.
----------------	-----------------------------------

### Exceptions

<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).

**6.710.3.5** `int decaf::util::concurrent::Semaphore::availablePermits ( ) const`

Returns the current number of permits available in this semaphore.

This method is typically used for debugging and testing purposes.

### Returns

the number of permits available in this semaphore

**6.710.3.6** `int decaf::util::concurrent::Semaphore::drainPermits ( ) throw ( decaf::lang::exceptions::RuntimeException )`

Acquires and returns all permits that are immediately available.

#### Returns

the number of permits acquired

#### Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while draining the <b>Semaphore</b> (p. 3434).
-------------------------	--

**6.710.3.7** `bool decaf::util::concurrent::Semaphore::isFair ( ) const`

#### Returns

true if this semaphore has fairness set true

**6.710.3.8** `void decaf::util::concurrent::Semaphore::release ( ) throw ( decaf::lang::exceptions::RuntimeException )`

Releases a permit, returning it to the semaphore.

Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 3438). Correct usage of a semaphore is established by programming convention in the application.

#### Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while releasing the <b>Semaphore</b> (p. 3434).
-------------------------	---

**6.710.3.9** `void decaf::util::concurrent::Semaphore::release ( int permits ) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException )`

Releases the given number of permits, returning them to the semaphore.

Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes;

otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

#### Parameters

<i>permits</i>	the number of permits to release
----------------	----------------------------------

#### Exceptions

<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while releasing the <b>Semaphore</b> (p. 3434).

#### 6.710.3.10 `std::string decaf::util::concurrent::Semaphore::toString ( ) const`

Returns a string identifying this semaphore, as well as its state.

The state, in brackets, includes the String "Permits =" followed by the number of permits.

#### Returns

a string identifying this semaphore, as well as its state

#### 6.710.3.11 `bool decaf::util::concurrent::Semaphore::tryAcquire ( int permits, long long timeout, const TimeUnit & unit ) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException )`

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

\* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or \* Some other thread interrupts the current thread; or \* The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

\* has its interrupted status set on entry to this method; or \* is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 3441).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 3441).

#### Parameters

<i>permits</i>	the number of permits to acquire
<i>timeout</i>	the maximum amount of time to wait to acquire the permits.
<i>unit</i>	the units that the timeout param represents.

#### Returns

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

#### Exceptions

<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).

**6.710.3.12** `bool decaf::util::concurrent::Semaphore::tryAcquire ( long long timeout, const TimeUnit & unit ) throw ( decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException )`

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

\* Some other thread invokes the **release()** (p. 3441) method for this semaphore and the current thread is next to be assigned a permit; or \* Some other thread interrupts the current thread; or \* The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

\* has its interrupted status set on entry to this method; or \* is interrupted while waiting to acquire a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

#### Parameters

<i>timeout</i>	the maximum time to wait for a permit
<i>unit</i>	the time unit of the timeout argument

#### Returns

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

#### Exceptions

<i>InterruptedException</i>	if the current thread is interrupted.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).

#### 6.710.3.13 `bool decaf::util::concurrent::Semaphore::tryAcquire ( ) throw ( decaf::lang::exceptions::RuntimeException )`

Acquires a permit from this semaphore, only if one is available at the time of invocation.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 3444) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use **tryAcquire(0, TimeUnit.SECONDS** (p. 3930)) which is almost equivalent (it also detects interruption).

#### Returns

true if a permit was acquired and false otherwise

#### Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).
-------------------------	---

**6.710.3.14** `bool decaf::util::concurrent::Semaphore::tryAcquire ( int permits )  
 throw ( decaf::lang::exceptions::IllegalArgumentException,  
 decaf::lang::exceptions::RuntimeException )`

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to tryAcquire will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(permits, 0, **TimeUnit.SECONDS** (p. 3930)) which is almost equivalent (it also detects interruption).

#### Parameters

<i>permits</i>	the number of permits to acquire
----------------	----------------------------------

#### Returns

true if the permits were acquired and false otherwise.

#### Exceptions

<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the <b>Semaphore</b> (p. 3434).

### 6.712.1 Detailed Description

This class implements server sockets. A server socket waits for requests to come in over the network.

The actual work of the server socket is performed by an instance of the **SocketImpl** (p. 3635) class. An application can change the socket factory that creates the socket implementation to configure itself to create sockets of a particular type.

#### Since

1.0

### 6.712.2 Constructor & Destructor Documentation

#### 6.712.2.1 decaf::net::ServerSocket::ServerSocket ( )

Creates a non-bound server socket.

#### 6.712.2.2 decaf::net::ServerSocket::ServerSocket ( int port ) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException )

Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 3644) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 3635) is created.

**Parameters**

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
-------------	--

**Exceptions**

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentException</i>	if the port value is negative or greater than 65535.

**6.712.2.3** `decaf::net::ServerSocket::ServerSocket ( int port,  
int backlog ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::IllegalArgumentException )`

Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3644) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 3635) is created.

**Parameters**

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.

**Exceptions**

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentException</i>	if the port value is negative or greater than 65535.

**6.712.2.4** `decaf::net::ServerSocket::ServerSocket ( int port, int backlog, const  
InetAddress * address ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::IllegalArgumentException )`

Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3644) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 3635) is created.

**Parameters**

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.
<i>ifAddress</i>	The IP Address to bind to on the local machine.

**Exceptions**

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentEx-ception</i>	if the port value is negative or greater than 65535.

**6.712.2.5 virtual decaf::net::ServerSocket::~ServerSocket ( ) [virtual]**

Releases socket handle if **close()** (p. 3453) hasn't been called.

**6.712.2.6 decaf::net::ServerSocket::ServerSocket ( SocketImpl \* impl ) [protected]**

Creates a **ServerSocket** (p. 3447) wrapping the provided **SocketImpl** (p. 3635) instance, this **Socket** (p. 3607) is considered unconnected.

The **ServerSocket** (p. 3447) class takes ownership of this **SocketImpl** (p. 3635) pointer and will delete it when the **Socket** (p. 3607) class is destroyed.

**Parameters**

<i>impl</i>	The <b>SocketImpl</b> (p. 3635) instance to wrap.
-------------	---

**Exceptions**

<i>NullPointerException</i>	if the passed <b>SocketImpl</b> (p. 3635) is Null.
-----------------------------	--

**6.712.3 Member Function Documentation****6.712.3.1 virtual Socket\* decaf::net::ServerSocket::accept ( ) throw ( decaf::io::IOException ) [virtual]**

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 3447), the caller blocks until a connection is made.

If the SO\_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 3650) if the operation times out.

**Returns**

a new **Socket** (p. 3607) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while binding the socket.
<i>SocketException</i> (p. 3627)	if an error occurs while blocking on the accept call.
<i>SocketTimeoutException</i> (p. 3650)	if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2932).

**6.712.3.2** `virtual void decaf::net::ServerSocket::bind ( const std::string & host, int port, int backlog ) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException ) [virtual]`

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

If the backlog is greater than zero it will be used instead of the default value, otherwise the default value is used and no error is generated.

**Parameters**

<i>host</i>	The IP address or host name.
<i>port</i>	The TCP port between 1..65535.
<i>backlog</i>	The size of listen backlog.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while binding the socket.
<i>IllegalArgumentException</i>	if the parameters are not valid.

**6.712.3.3** `virtual void decaf::net::ServerSocket::bind ( const std::string & host, int port ) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException ) [virtual]`

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

**Parameters**

<i>host</i>	The IP address or host name.
<i>port</i>	The TCP port between 1..65535.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while binding the socket.
--------------------	--

<i>IllegalArgumentException</i>	if the parameters are not valid.
---------------------------------	----------------------------------

**6.712.3.4** void decaf::net::ServerSocket::checkClosed ( ) const throw ( decaf::io::IOException ) [protected]

**6.712.3.5** virtual void decaf::net::ServerSocket::close ( ) throw ( decaf::io::IOException ) [virtual]

Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

**6.712.3.6** void decaf::net::ServerSocket::ensureCreated ( ) const throw ( decaf::io::IOException ) [protected]

**6.712.3.7** virtual int decaf::net::ServerSocket::getDefaultBacklog ( ) [protected, virtual]

Allows a subclass to override what is considered the default backlog.

#### Returns

the default backlog for connections.

**6.712.3.8** virtual int decaf::net::ServerSocket::getLocalPort ( ) const [virtual]

Gets the port number on the Local machine that this **ServerSocket** (p.3447) is bound to.

#### Returns

the port number of this machine that is bound, if not bound returns -1.

**6.712.3.9** virtual int decaf::net::ServerSocket::getReceiveBufferSize ( ) const throw ( SocketException ) [virtual]

Gets the receive buffer size for this socket, SO\_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

**Returns**

the receive buffer size in bytes.

**Exceptions**

<i><b>SocketException</b></i> (p. 3627)	if the operation fails.
--	-------------------------

**6.712.3.10** `virtual bool decaf::net::ServerSocket::getReuseAddress ( ) const throw ( SocketException )` [virtual]

Gets the reuse address flag, SO\_REUSEADDR.

**Returns**

True if the address can be reused.

**Exceptions**

<i><b>SocketException</b></i> (p. 3627)	if the operation fails.
--	-------------------------

**6.712.3.11** `virtual int decaf::net::ServerSocket::getSoTimeout ( ) const throw ( SocketException )` [virtual]

Gets the timeout for socket operations, SO\_TIMEOUT.

**Returns**

The timeout in milliseconds for socket operations.

**Exceptions**

<i><b>SocketException</b></i> (p. 3627)	Thrown if unable to retrieve the information.
--	---

**6.712.3.12** `virtual void decaf::net::ServerSocket::implAccept ( Socket * socket ) throw ( decaf::io::IOException )` [protected, virtual]

Virtual method that allows a **ServerSocket** (p. 3447) subclass to override the accept call and provide its own **SocketImpl** (p. 3635) for the socket.

**Parameters**

<i>socket</i>	The socket object whose <b>SocketImpl</b> (p. 3635) should be used for the accept call.
---------------	---

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

**6.712.3.13** virtual bool decaf::net::ServerSocket::isBound ( ) const [virtual]

**Returns**

true if the server socket is bound.

**6.712.3.14** virtual bool decaf::net::ServerSocket::isClosed ( ) const [virtual]

**Returns**

true if the close method has been called on the **ServerSocket** (p. 3447).

**6.712.3.15** virtual void decaf::net::ServerSocket::setReceiveBufferSize ( int *size* ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException ) [virtual]

Sets the receive buffer size for this socket, SO\_RCVBUF.

**Parameters**

<i>size</i>	Number of bytes to set the receive buffer to.
-------------	---

**Exceptions**

<i>SocketException</i> (p. 3627)	if the operation fails.
<i>IllegalArgumentException</i>	if the value is zero or negative.

**6.712.3.16** virtual void decaf::net::ServerSocket::setReuseAddress ( bool *reuse* ) throw ( SocketException ) [virtual]

Sets the reuse address flag, SO\_REUSEADDR.

**Parameters**

<i>reuse</i>	If true, sets the flag.
--------------	-------------------------

**Exceptions**

<i>SocketException</i> (p. 3627)	if the operation fails.
-------------------------------------	-------------------------

**6.712.3.17** `static void decaf::net::ServerSocket::setSocketImplFactory ( SocketImplFactory * factory ) throw ( decaf::io::IOException, decaf::net::SocketException )`  
`[static]`

Sets the instance of a **SocketImplFactory** (p. 3644) that the **ServerSocket** (p. 3447) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

#### Parameters

<i>factory</i>	The instance of a <b>SocketImplFactory</b> (p. 3644) to use when new <b>SocketImpl</b> (p. 3635) objects are created.
----------------	---

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
<i>SocketException</i> (p. 3627)	if this method has already been called with a valid factory.

**6.712.3.18** `virtual void decaf::net::ServerSocket::setSoTimeout ( int timeout ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )`  
`[virtual]`

Sets the timeout for socket operations, SO\_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

#### Parameters

<i>timeout</i>	The timeout in milliseconds for socket operations.
----------------	--

#### Exceptions

<i>SocketException</i> (p. 3627)	Thrown if unable to set the information.
<i>IllegalArgumentException</i>	if the timeout value is negative.

**6.712.3.19** `void decaf::net::ServerSocket::setupSocketImpl ( int port, int backlog, const InetAddress * ifAddress )` `[protected]`

**6.712.3.20** `virtual std::string decaf::net::ServerSocket::toString ( ) const` `[virtual]`

#### Returns

a string representing this **ServerSocket** (p. 3447).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ServerSocket.h`

## 6.713 decaf::net::ServerSocketFactory Class Reference

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

```
#include <src/main/decaf/net/ServerSocketFactory.h>
```

#### 6.713.1 Detailed Description

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

**Since**

1.0

**6.713.2 Constructor & Destructor Documentation****6.713.2.1** `decaf::net::ServerSocketFactory::ServerSocketFactory ( )` [protected]**6.713.2.2** `virtual decaf::net::ServerSocketFactory::~ServerSocketFactory ( )` [virtual]**6.713.3 Member Function Documentation****6.713.3.1** `virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket ( )`  
[virtual]Create a new **ServerSocket** (p. 3447) that is unbound.The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory.**Returns**new **ServerSocket** (p. 3447) pointer that is owned by the caller.**Exceptions***IOException* if the **ServerSocket** (p. 3447) cannot be created for some reason.Reimplemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1736), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1747), and **decaf::internal::net::ssl::openssl::DefaultSSLServerSocketFactory** (p. 2938).**6.713.3.2** `virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket ( int port )` [pure virtual]Create a new **ServerSocket** (p. 3447) that is bound to the given port.The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory.**Parameters***port* The port to bind the **ServerSocket** (p. 3447) to.**Returns**new **ServerSocket** (p. 3447) pointer that is owned by the caller.**Exceptions***IOException* if the **ServerSocket** (p. 3447) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1738), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1747), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2938).

**6.713.3.3** `virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket ( int port, int backlog, const InetAddress * address ) [pure virtual]`

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3447) will listen on all interfaces.

#### Parameters

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The number of pending connect request the <b>ServerSocket</b> (p. 3447) can queue.
<i>address</i>	The address of the interface on the local machine to bind to.

#### Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

#### Exceptions

<i>IOException</i>	if the <b>ServerSocket</b> (p. 3447) cannot be created for some reason.
--------------------	---

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1737), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1748), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2939).

**6.713.3.4** `virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket ( int port, int backlog ) [pure virtual]`

Create a new **ServerSocket** (p. 3447) that is bound to the given port.

The **ServerSocket** (p. 3447) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3447) will use the specified connection backlog setting.

#### Parameters

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The number of pending connect request the <b>ServerSocket</b> (p. 3447) can queue.

#### Returns

new **ServerSocket** (p. 3447) pointer that is owned by the caller.

**Exceptions**

*IOException* if the **ServerSocket** (p. 3447) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1737), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1748), and **decaf::internal::net::ssl::openssl::DefaultSSLServerSocketFactory** (p. 2939).

**6.713.3.5 static ServerSocketFactory\* decaf::net::ServerSocketFactory::getDefault ( )**  
[static]

Returns the Default **ServerSocket** (p. 3447) factory, the pointer is owned by the Decaf runtime and should not be deleted by the caller.

Only one default **ServerSocketFactory** (p. 3457) exists for the lifetime of the Application.

**Returns**

the default **ServerSocketFactory** (p. 3457) for this application.

Reimplemented in **decaf::net::ssl::SSLServerSocketFactory** (p. 3669).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ServerSocketFactory.h**

**6.714 cms::Session Class Reference**

A **Session** (p. 3460) object is a single-threaded context for producing and consuming messages.

```
#include <src/main/cms/Session.h>
```

Inheritance diagram for cms::Session:

**Public Types**

- enum **AcknowledgeMode** {  
    **AUTO\_ACKNOWLEDGE**, **DUPS\_OK\_ACKNOWLEDGE**, **CLIENT\_ACKNOWLEDGE**,  
    **SESSION\_TRANSACTED**,  
    **INDIVIDUAL\_ACKNOWLEDGE** }

**Public Member Functions**

- virtual **~Session** ()

- virtual void **close** ()=0 throw ( CMSEException )  
*Closes this session as well as any active child consumers or producers.*
- virtual void **commit** ()=0 throw ( CMSEException )  
*Commits all messages done in this transaction and releases any locks currently held.*
- virtual void **rollback** ()=0 throw ( CMSEException )  
*Rolls back all messages done in this transaction and releases any locks currently held.*
- virtual void **recover** ()=0 throw ( CMSEException )  
*Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.*
- virtual **MessageConsumer** \* **createConsumer** (const **Destination** \*destination)=0 throw ( CMSEException )  
*Creates a **MessageConsumer** (p. 2674) for the specified destination.*
- virtual **MessageConsumer** \* **createConsumer** (const **Destination** \*destination, const std::string &selector)=0 throw ( CMSEException )  
*Creates a **MessageConsumer** (p. 2674) for the specified destination, using a message selector.*
- virtual **MessageConsumer** \* **createConsumer** (const **Destination** \*destination, const std::string &selector, bool noLocal)=0 throw ( CMSEException )  
*Creates a **MessageConsumer** (p. 2674) for the specified destination, using a message selector.*
- virtual **MessageConsumer** \* **createDurableConsumer** (const **Topic** \*destination, const std::string &name, const std::string &selector, bool noLocal=false)=0 throw ( CMSEException )  
*Creates a durable subscriber to the specified topic, using a **Message** (p. 2614) selector.*
- virtual **MessageProducer** \* **createProducer** (const **Destination** \*destination)=0 throw ( CMSEException )  
*Creates a **MessageProducer** (p. 2809) to send messages to the specified destination.*
- virtual **QueueBrowser** \* **createBrowser** (const **cms::Queue** \*queue)=0 throw ( CMSEException )  
*Creates a new **QueueBrowser** (p. 3243) to peek at Messages on the given **Queue** (p. 3238).*
- virtual **QueueBrowser** \* **createBrowser** (const **cms::Queue** \*queue, const std::string &selector)=0 throw ( CMSEException )  
*Creates a new **QueueBrowser** (p. 3243) to peek at Messages on the given **Queue** (p. 3238).*

- virtual **Queue** \* **createQueue** (const std::string &queueName)=0 throw ( CMSEException )  
*Creates a queue identity given a **Queue** (p. 3238) name.*
- virtual **Topic** \* **createTopic** (const std::string &topicName)=0 throw ( CMSEException )  
*Creates a topic identity given a **Queue** (p. 3238) name.*
- virtual **TemporaryQueue** \* **createTemporaryQueue** ()=0 throw ( CMSEException )  
*Creates a **TemporaryQueue** (p. 3871) object.*
- virtual **TemporaryTopic** \* **createTemporaryTopic** ()=0 throw ( CMSEException )  
*Creates a **TemporaryTopic** (p. 3873) object.*
- virtual **Message** \* **createMessage** ()=0 throw ( CMSEException )  
*Creates a new **Message** (p. 2614).*
- virtual **BytesMessage** \* **createBytesMessage** ()=0 throw ( CMSEException )  
*Creates a **BytesMessage** (p. 1079).*
- virtual **BytesMessage** \* **createBytesMessage** (const unsigned char \*bytes, int bytesSize)=0 throw ( CMSEException )  
*Creates a **BytesMessage** (p. 1079) and sets the payload to the passed value.*
- virtual **StreamMessage** \* **createStreamMessage** ()=0 throw ( CMSEException )  
*Creates a new **StreamMessage** (p. 3760).*
- virtual **TextMessage** \* **createTextMessage** ()=0 throw ( CMSEException )  
*Creates a new **TextMessage** (p. 3874).*
- virtual **TextMessage** \* **createTextMessage** (const std::string &text)=0 throw ( CMSEException )  
*Creates a new **TextMessage** (p. 3874) and set the text to the value given.*
- virtual **MapMessage** \* **createMapMessage** ()=0 throw ( CMSEException )  
*Creates a new **MapMessage** (p. 2551).*
- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0 throw ( CMSEException )  
*Returns the acknowledgment mode of the session.*
- virtual bool **isTransacted** () const =0 throw ( CMSEException )  
*Gets if the Sessions is a Transacted **Session** (p. 3460).*

- virtual void **unsubscribe** (const std::string &name)=0 throw ( CMSEException )

*Unsubscribes a durable subscription that has been created by a client.*

### 6.714.1 Detailed Description

A **Session** (p. 3460) object is a single-threaded context for producing and consuming messages. A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.
- It is a factory for TemporaryTopics and TemporaryQueues.
- It provides a way to create **Queue** (p. 3238) or **Topic** (p. 3930) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 2674) until a message arrives. The thread may then use one or more of the Session's MessageProducers.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's `close` method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 3460) method that can be called concurrently.
- Invoking any other **Session** (p. 3460) method on a closed session must throw an **IllegalStateException** (p. 2059). Closing a closed session must not throw any exceptions.

### Transacted Sessions

When a **Session** (p. 3460) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 3460) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 3460). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 2809) this implies that all messages sent by the producer are not sent to the Provider until the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 2674) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 2614) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 2614).

### Since

1.0

## 6.714.2 Member Enumeration Documentation

### 6.714.2.1 enum cms::Session::AcknowledgeMode

#### Enumerator:

**AUTO\_ACKNOWLEDGE** With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

**DUPS\_OK\_ACKNOWLEDGE** With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

**CLIENT\_ACKNOWLEDGE** With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

**SESSION\_TRANSACTED** Messages will be consumed when the transaction commits.

**INDIVIDUAL\_ACKNOWLEDGE** **Message** (p. 2614) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

### 6.714.3 Constructor & Destructor Documentation

6.714.3.1 `virtual cms::Session::~~Session ( ) [inline, virtual]`

### 6.714.4 Member Function Documentation

6.714.4.1 `virtual void cms::Session::close ( ) throw ( CMSEException ) [pure virtual]`

Closes this session as well as any active child consumers or producers.

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implements `cms::Closeable` (p. 1180).

Implemented in `activemq::cmsutil::PooledSession` (p. 3045), and `activemq::core::ActiveMQSession` (p. 518).

6.714.4.2 `virtual void cms::Session::commit ( ) throw ( CMSEException ) [pure virtual]`

Commits all messages done in this transaction and releases any locks currently held.

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>IllegalStateException</i></b> (p. 2059)	- if the method is not called by a transacted session.

Implemented in `activemq::cmsutil::PooledSession` (p. 3045), and `activemq::core::ActiveMQSession` (p. 518).

Referenced by `activemq::cmsutil::PooledSession::commit()`.

6.714.4.3 `virtual QueueBrowser* cms::Session::createBrowser ( const cms::Queue * queue ) throw ( CMSEException ) [pure virtual]`

Creates a new `QueueBrowser` (p. 3243) to peek at Messages on the given `Queue` (p. 3238).

#### Parameters

<i>queue</i>	the <code>Queue</code> (p. 3238) to browse
--------------	--

**Returns**

New **QueueBrowser** (p. 3243) that is owned by the caller.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>InvalidDestinationException</i></b> (p. 2200)	- if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 3046), and **activemq::core::ActiveMQSession** (p. 518).

**6.714.4.4** `virtual QueueBrowser* cms::Session::createBrowser ( const cms::Queue *  
queue, const std::string & selector ) throw ( CMSEException ) [pure  
virtual]`

Creates a new **QueueBrowser** (p. 3243) to peek at Messages on the given **Queue** (p. 3238).

**Parameters**

<i>queue</i>	the <b>Queue</b> (p. 3238) to browse
<i>selector</i>	the <b>Message</b> (p. 2614) selector to filter which messages are browsed.

**Returns**

New **QueueBrowser** (p. 3243) that is owned by the caller.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>InvalidDestinationException</i></b> (p. 2200)	- if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 3045), and **activemq::core::ActiveMQSession** (p. 519).

**6.714.4.5** `virtual BytesMessage* cms::Session::createBytesMessage ( ) throw ( CMSEException ) [pure virtual]`

Creates a **BytesMessage** (p. 1079).

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3046), and **activemq::core::ActiveMQSession** (p. 519).

**6.714.4.6** `virtual BytesMessage* cms::Session::createBytesMessage ( const unsigned char * bytes, int bytesSize ) throw ( CMSEException ) [pure virtual]`

Creates a **BytesMessage** (p. 1079) and sets the payload to the passed value.

#### Parameters

<i>bytes</i>	an array of bytes to set in the message
<i>bytesSize</i>	the size of the bytes array, or number of bytes to use

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3047), and **activemq::core::ActiveMQSession** (p. 520).

**6.714.4.7** `virtual MessageConsumer* cms::Session::createConsumer ( const Destination * destination ) throw ( CMSEException ) [pure virtual]`

Creates a **MessageConsumer** (p. 2674) for the specified destination.

#### Parameters

<i>destination</i>	the <b>Destination</b> (p. 1776) that this consumer receiving messages for.
--------------------	---

#### Returns

pointer to a new **MessageConsumer** (p. 2674) that is owned by the caller ( caller deletes )

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>InvalidDestinationException</i></b> (p. 2200)	- if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 3048), and **activemq::core::ActiveMQSession** (p. 521).

**6.714.4.8** `virtual MessageConsumer* cms::Session::createConsumer ( const Destination  
* destination, const std::string & selector ) throw ( CMSEException ) [pure  
virtual]`

Creates a **MessageConsumer** (p. 2674) for the specified destination, using a message selector.

#### Parameters

<i>destination</i>	the <b>Destination</b> (p. 1776) that this consumer receiving messages for.
<i>selector</i>	the <b>Message</b> (p. 2614) Selector to use

#### Returns

pointer to a new **MessageConsumer** (p. 2674) that is owned by the caller ( caller deletes )

#### Exceptions

<b>CMSEException</b> (p. 1190)	- If an internal error occurs.
<b>InvalidDestinationException</b> (p. 2200)	- if an invalid destination is specified.
<b>InvalidSelectorException</b> (p. 2206)	- if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 3048), and **activemq::core::ActiveMQSession** (p. 520).

**6.714.4.9** `virtual MessageConsumer* cms::Session::createConsumer ( const Destination  
* destination, const std::string & selector, bool noLocal ) throw ( CMSEException )  
[pure virtual]`

Creates a **MessageConsumer** (p. 2674) for the specified destination, using a message selector.

#### Parameters

<i>destination</i>	the <b>Destination</b> (p. 1776) that this consumer receiving messages for.
<i>selector</i>	the <b>Message</b> (p. 2614) Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

#### Returns

pointer to a new **MessageConsumer** (p. 2674) that is owned by the caller ( caller deletes )

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>InvalidDestinationException</i></b> (p. 2200)	- if an invalid destination is specified.
<b><i>InvalidSelectorException</i></b> (p. 2206)	- if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 3049), and **activemq::core::ActiveMQSession** (p. 520).

**6.714.4.10** `virtual MessageConsumer* cms::Session::createDurableConsumer ( const Topic * destination, const std::string & name, const std::string & selector, bool noLocal = false ) throw ( CMSException ) [pure virtual]`

Creates a durable subscriber to the specified topic, using a **Message** (p. 2614) selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

**Parameters**

<i>destination</i>	the topic to subscribe to
<i>name</i>	The name used to identify the subscription
<i>selector</i>	the <b>Message</b> (p. 2614) Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

**Returns**

pointer to a new durable **MessageConsumer** (p. 2674) that is owned by the caller ( caller deletes )

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>InvalidDestinationException</i></b> (p. 2200)	- if an invalid destination is specified.
<b><i>InvalidSelectorException</i></b> (p. 2206)	- if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 3049), and **activemq::core::ActiveMQSession** (p. 521).

**6.714.4.11** `virtual MapMessage* cms::Session::createMapMessage ( ) throw ( CMSException )` [pure virtual]

Creates a new **MapMessage** (p. 2551).

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- If an internal error occurs.
---	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3050), and **activemq::core::ActiveMQSession** (p. 522).

**6.714.4.12** `virtual Message* cms::Session::createMessage ( ) throw ( CMSException )` [pure virtual]

Creates a new **Message** (p. 2614).

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- If an internal error occurs.
---	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3050), and **activemq::core::ActiveMQSession** (p. 522).

**6.714.4.13** `virtual MessageProducer* cms::Session::createProducer ( const Destination * destination ) throw ( CMSException )` [pure virtual]

Creates a **MessageProducer** (p. 2809) to send messages to the specified destination.

#### Parameters

<i>destination</i>	the <b>Destination</b> (p. 1776) to send on
--------------------	---

#### Returns

New **MessageProducer** (p. 2809) that is owned by the caller.

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>InvalidDestinationException</i></b> (p. 2200)	- if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 3051), and **activemq::core::ActiveMQSession** (p. 522).

**6.714.4.14** `virtual Queue* cms::Session::createQueue ( const std::string & queueName )  
throw ( CMSEException ) [pure virtual]`

Creates a queue identity given a **Queue** (p. 3238) name.

#### Parameters

<i>queueName</i>	the name of the new <b>Queue</b> (p. 3238)
------------------	--

#### Returns

new **Queue** (p. 3238) pointer that is owned by the caller.

#### Exceptions

<i>CMSEException</i> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3051), and **activemq::core::ActiveMQSession** (p. 522).

**6.714.4.15** `virtual StreamMessage* cms::Session::createStreamMessage ( ) throw ( CMSEException ) [pure virtual]`

Creates a new **StreamMessage** (p. 3760).

#### Exceptions

<i>CMSEException</i> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3052), and **activemq::core::ActiveMQSession** (p. 523).

**6.714.4.16** `virtual TemporaryQueue* cms::Session::createTemporaryQueue ( ) throw ( CMSEException ) [pure virtual]`

Creates a **TemporaryQueue** (p. 3871) object.

#### Returns

new **TemporaryQueue** (p. 3871) pointer that is owned by the caller.

#### Exceptions

<i>CMSEException</i> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3052), and **activemq::core::ActiveMQSession** (p. 523).

**6.714.4.17** `virtual TemporaryTopic* cms::Session::createTemporaryTopic ( ) throw ( CMSEException ) [pure virtual]`

Creates a **TemporaryTopic** (p. 3873) object.

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3052), and **activemq::core::ActiveMQSession** (p. 523).

**6.714.4.18** `virtual TextMessage* cms::Session::createTextMessage ( const std::string & text ) throw ( CMSEException ) [pure virtual]`

Creates a new **TextMessage** (p. 3874) and set the text to the value given.

#### Parameters

<i>text</i>	the initial text for the message
-------------	----------------------------------

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3052), and **activemq::core::ActiveMQSession** (p. 524).

**6.714.4.19** `virtual TextMessage* cms::Session::createTextMessage ( ) throw ( CMSEException ) [pure virtual]`

Creates a new **TextMessage** (p. 3874).

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3053), and **activemq::core::ActiveMQSession** (p. 524).

**6.714.4.20** `virtual Topic* cms::Session::createTopic ( const std::string & topicName ) throw ( CMSEException )` [pure virtual]

Creates a topic identity given a **Queue** (p. 3238) name.

#### Parameters

<i>topicName</i>	the name of the new <b>Topic</b> (p. 3930)
------------------	--

#### Returns

new **Topic** (p. 3930) pointer that is owned by the caller.

#### Exceptions

<b>CMSEException</b> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3053), and **activemq::core::ActiveMQSession** (p. 524).

**6.714.4.21** `virtual AcknowledgeMode cms::Session::getAcknowledgeMode ( ) const throw ( CMSEException )` [pure virtual]

Returns the acknowledgment mode of the session.

#### Returns

the Sessions Acknowledge Mode

#### Exceptions

<b>CMSEException</b> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3053), and **activemq::core::ActiveMQSession** (p. 525).

**6.714.4.22** `virtual bool cms::Session::isTransacted ( ) const throw ( CMSEException )` [pure virtual]

Gets if the Sessions is a Transacted **Session** (p. 3460).

#### Returns

transacted true - false.

#### Exceptions

<b>CMSEException</b> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3054), and **activemq::core::ActiveMQSession** (p. 528).

**6.714.4.23** `virtual void cms::Session::recover ( ) throw ( CMSException )` [pure virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "re-delivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to stop and restart message delivery due to some internal error.
<b><i>IllegalStateException</i></b> (p. 2059)	- if the method is called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 3054), and **activemq::core::ActiveMQSession** (p. 528).

**6.714.4.24** `virtual void cms::Session::rollback ( ) throw ( CMSException )` [pure virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- If an internal error occurs.
<b><i>IllegalStateException</i></b> (p. 2059)	- if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 3055), and **activemq::core::ActiveMQSession** (p. 530).

**6.714.4.25** virtual void cms::Session::unsubscribe ( const std::string & *name* ) throw ( CMSException ) [pure virtual]

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 2674) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

#### Parameters

<i>name</i>	The name used to identify this subscription
-------------	---

#### Exceptions

<b>CMSException</b> (p. 1190)	- If an internal error occurs.
----------------------------------	--------------------------------

Implemented in **activemq::cmsutil::PooledSession** (p. 3055), and **activemq::core::ActiveMQSession** (p. 531).

The documentation for this class was generated from the following file:

- src/main/cms/Session.h

## 6.715 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

```
#include <src/main/activemq/cmsutil/SessionCallback.h>
```

Inheritance diagram for activemq::cmsutil::SessionCallback:

#### Public Member Functions

- virtual ~SessionCallback ()
- virtual void doInCms (cms::Session \*session)=0 throw ( cms::CMSException )

*Execute any number of operations against the supplied CMS session.*

### 6.715.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

## 6.715.2 Constructor & Destructor Documentation

6.715.2.1 `virtual activemq::cmsutil::SessionCallback::~SessionCallback ( ) [inline, virtual]`

## 6.715.3 Member Function Documentation

6.715.3.1 `virtual void activemq::cmsutil::SessionCallback::doInCms ( cms::Session * session ) throw ( cms::CMSException ) [pure virtual]`

Execute any number of operations against the supplied CMS session.

### Parameters

<i>session</i>	the CMS Session
----------------	-----------------

### Exceptions

<i>cms::CMSException</i> (p. 1190)	if thrown by CMS API methods
---------------------------------------	------------------------------

Implemented in `activemq::cmsutil::CmsTemplate::ProducerExecutor` (p. 3156), and `activemq::cmsutil::CmsTemplate::ReceiveExecutor` (p. 3266).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/SessionCallback.h`

## 6.716 activemq::commands::SessionId Class Reference

```
#include <src/main/activemq/commands/SessionId.h>
```

Inheritance diagram for `activemq::commands::SessionId`:

### Public Types

- `typedef decaf::lang::PointerComparator< SessionId > COMPARATOR`

### Public Member Functions

- `SessionId ()`
- `SessionId (const SessionId &other)`
- `SessionId (const ConnectionId *connectionId, long long sessionId)`
- `SessionId (const ProducerId *producerId)`
- `SessionId (const ConsumerId *consumerId)`

- virtual `~SessionId ()`
- virtual unsigned char `getDataStructureType ()` const  
*Get the unique identifier that this object and its own Marshaler share.*
- virtual `SessionId * cloneDataStructure ()` const  
*Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.*
- virtual void `copyDataStructure (const DataStructure *src)`  
*Copy the contents of the passed object into this object's members, overwriting any existing data.*
- virtual std::string `toString ()` const  
*Returns a string containing the information for this DataStructure (p. 1713) such as its type and value of its elements.*
- virtual bool `equals (const DataStructure *value)` const  
*Compares the DataStructure (p. 1713) passed in to this one, and returns if they are equivalent.*
- const `Pointer< ConnectionId > & getParentId ()` const
- virtual const std::string & `getConnectionId ()` const
- virtual std::string & `getConnectionId ()`
- virtual void `setConnectionId (const std::string &connectionId)`
- virtual long long `getValue ()` const
- virtual void `setValue (long long value)`
- virtual int `compareTo (const SessionId &value)` const
- virtual bool `equals (const SessionId &value)` const
- virtual bool `operator== (const SessionId &value)` const
- virtual bool `operator< (const SessionId &value)` const
- `SessionId & operator= (const SessionId &other)`

### Static Public Attributes

- static const unsigned char `ID_SESSIONID = 121`

### Protected Attributes

- std::string `connectionId`
- long long `value`

**6.716.1 Member Typedef Documentation**

6.716.1.1 `typedef decaf::lang::PointerComparator<SessionId>`  
`activemq::commands::SessionId::COMPARATOR`

**6.716.2 Constructor & Destructor Documentation**

6.716.2.1 `activemq::commands::SessionId::SessionId ( )`

6.716.2.2 `activemq::commands::SessionId::SessionId ( const SessionId & other )`

6.716.2.3 `activemq::commands::SessionId::SessionId ( const ConnectionId * connectionId,`  
`long long sessionId )`

6.716.2.4 `activemq::commands::SessionId::SessionId ( const ProducerId * producerId )`

6.716.2.5 `activemq::commands::SessionId::SessionId ( const ConsumerId * consumerId )`

6.716.2.6 `virtual activemq::commands::SessionId::~~SessionId ( ) [virtual]`

**6.716.3 Member Function Documentation**

6.716.3.1 `virtual SessionId* activemq::commands::SessionId::cloneDataStructure ( ) const`  
`[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

**Returns**

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.716.3.2 `virtual int activemq::commands::SessionId::compareTo ( const SessionId & value )`  
`const [virtual]`

6.716.3.3 `virtual void activemq::commands::SessionId::copyDataStructure ( const`  
`DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

**Parameters**

<code>src</code>	- Source Object
------------------	-----------------

Implements `activemq::commands::DataStructure` (p. 1715).

**6.716.3.4** `virtual bool activemq::commands::SessionId::equals ( const DataStructure * value ) const [virtual]`

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

### Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

**6.716.3.5** `virtual bool activemq::commands::SessionId::equals ( const SessionId & value ) const [virtual]`

**6.716.3.6** `virtual std::string& activemq::commands::SessionId::getConnectionId ( ) [virtual]`

**6.716.3.7** `virtual const std::string& activemq::commands::SessionId::getConnectionId ( ) const [virtual]`

**6.716.3.8** `virtual unsigned char activemq::commands::SessionId::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

### Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

- 6.716.3.9 `const Pointer<ConnectionId>& activemq::commands::SessionId::getParentId ( ) const`
- 6.716.3.10 `virtual long long activemq::commands::SessionId::getValue ( ) const`  
[virtual]
- 6.716.3.11 `virtual bool activemq::commands::SessionId::operator< ( const SessionId & value ) const` [virtual]
- 6.716.3.12 `SessionId& activemq::commands::SessionId::operator= ( const SessionId & other )`
- 6.716.3.13 `virtual bool activemq::commands::SessionId::operator==( const SessionId & value ) const` [virtual]
- 6.716.3.14 `virtual void activemq::commands::SessionId::setConnectionId ( const std::string & connectionId )` [virtual]
- 6.716.3.15 `virtual void activemq::commands::SessionId::setValue ( long long value )`  
[virtual]
- 6.716.3.16 `virtual std::string activemq::commands::SessionId::toString ( ) const`  
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

### 6.716.4 Field Documentation

- 6.716.4.1 `std::string activemq::commands::SessionId::connectionId`  
[protected]
- 6.716.4.2 `const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

- 6.716.4.3 `long long activemq::commands::SessionId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/SessionId.h`

## 6.717 activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3481).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/SessionIdMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller:

### Public Member Functions

### 6.717.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3481). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.717.2 Constructor & Destructor Documentation

6.717.2.1 **activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::SessionIdMarshaller**  
( ) [inline]

6.717.2.2 **virtual activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::~~SessionIdMarshaller**  
( ) [inline, virtual]

### 6.717.3 Member Function Documentation

6.717.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.717.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.717.3.3 **virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

## 6.717 activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller Class Reference 3487

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.717.3.4** virtual void **activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.717.3.5** virtual int **activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.717.3.6  virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.717.3.7  virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/SessionIdMarshaller.h

## 6.718 activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3485).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/SessionIdMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller:

### 6.718.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3485). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.718.2 Constructor & Destructor Documentation

6.718.2.1 **activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::SessionIdMarshaller**  
( ) [inline]

6.718.2.2 **virtual activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::~~SessionIdMarshaller**  
( ) [inline, virtual]

### 6.718.3 Member Function Documentation

6.718.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.718.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.718.3.3 **virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

## 6.718 activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller Class Reference 3491

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

```
6.718.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseUnmarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
  * dataStructure, decaf::io::DataInputStream * dataIn ) throw (  
  decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

```
6.718.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal1  
( OpenWireFormat * wireFormat, commands::DataStructure *  
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.718.3.6  virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.718.3.7  virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

( ) [inline]

6.719.2.2 **virtual activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::~~SessionIdMarshaller**  
( ) [inline, virtual]

### 6.719.3 Member Function Documentation

6.719.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.719.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.719.3.3 **virtual void activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

## 6.719 activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller Class Reference 3495

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

```
6.719.3.4 virtual void activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::looseUnmarshal  
( OpenWireFormat * wireFormat, commands::DataStructure  
  * dataStructure, decaf::io::DataInputStream * dataIn ) throw (  
  decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

```
6.719.3.5 virtual int activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::tightMarshal1  
( OpenWireFormat * wireFormat, commands::DataStructure *  
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.719.3.6  virtual void activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.719.3.7  virtual void activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

```
6.720.3.5 virtual int activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal1  
( OpenWireFormat * wireFormat, commands::DataStructure *  
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )  
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.720.3.6  virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.720.3.7  virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.721.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.721.3.3 **virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

## 6.721 activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller Class Reference 3503

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.721.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )` [virtual]

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.721.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.721.3.6  virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.721.3.7  virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

6.722.2.1 **activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::SessionIdMarshaller**  
( ) [inline]

6.722.2.2 **virtual activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::~~SessionIdMarshaller**  
( ) [inline, virtual]

### 6.722.3 Member Function Documentation

6.722.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.722.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.722.3.3 **virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.722.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )` [virtual]

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.722.3.5** `virtual int activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.722.3.6  virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.722.3.7  virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshall/v1/SessionIdMarshaller.h

## 6.723 activemq::commands::SessionInfo Class Reference

```
#include <src/main/activemq/commands/SessionInfo.h>
```

Inheritance diagram for activemq::commands::SessionInfo:

### Public Member Functions

- **SessionInfo** ()
- virtual **~SessionInfo** ()
- virtual unsigned char **getDataStructureType** () const  
*Get the unique identifier that this object and its own Marshaler share.*
- virtual **SessionInfo** \* **cloneDataStructure** () const  
*Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.*
- virtual void **copyDataStructure** (const **DataStructure** \*src)  
*Copy the contents of the passed object into this object's members, overwriting any existing data.*
- virtual std::string **toString** () const  
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** \*value) const  
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- unsigned int **getAckMode** () const
- void **setAckMode** (unsigned int mode)
- **Pointer**< **RemoveInfo** > **createRemoveCommand** () const
- virtual const **Pointer**< **SessionId** > & **getSessionId** () const
- virtual **Pointer**< **SessionId** > & **getSessionId** ()
- virtual void **setSessionId** (const **Pointer**< **SessionId** > &sessionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor \*visitor)  
throw ( exceptions::ActiveMQException )  
*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

**Static Public Attributes**

- static const unsigned char **ID\_SESSIONINFO** = 4

**Protected Attributes**

- **Pointer< SessionId > sessionId**

**6.723.1 Constructor & Destructor Documentation**

6.723.1.1 **activemq::commands::SessionInfo::SessionInfo ( )**

6.723.1.2 **virtual activemq::commands::SessionInfo::~~SessionInfo ( )** [virtual]

**6.723.2 Member Function Documentation**

6.723.2.1 **virtual SessionInfo\* activemq::commands::SessionInfo::cloneDataStructure ( )**  
**const** [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

**Returns**

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

6.723.2.2 **virtual void activemq::commands::SessionInfo::copyDataStructure ( const DataStructure \* *src* )** [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

**Parameters**

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

**6.723.2.3** `Pointer<RemoveInfo> activemq::commands::SessionInfo::createRemoveCommand ( ) const`

**6.723.2.4** `virtual bool activemq::commands::SessionInfo::equals ( const DataStructure * value ) const [virtual]`

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

**6.723.2.5** `unsigned int activemq::commands::SessionInfo::getAckMode ( ) const [inline]`

**6.723.2.6** `virtual unsigned char activemq::commands::SessionInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataStructure** (p. 1713) type copy.

Implements **activemq::commands::DataStructure** (p. 1717).

**6.723.2.7** `virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ( ) const [virtual]`

**6.723.2.8** `virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ( ) [virtual]`

**6.723.2.9** `void activemq::commands::SessionInfo::setAckMode ( unsigned int mode ) [inline]`

**6.723.2.10** `virtual void activemq::commands::SessionInfo::setSessionId ( const Pointer<SessionId> & sessionId ) [virtual]`

**6.723.2.11** `virtual std::string activemq::commands::SessionInfo::toString ( ) const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

**Returns**

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.723.2.12** `virtual Pointer<Command> activemq::commands::SessionInfo::visit  
( activemq::state::CommandVisitor * visitor ) throw (  
exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

**Returns**

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

**6.723.3 Field Documentation**

**6.723.3.1** `const unsigned char activemq::commands::SessionInfo::ID_ -  
SESSIONINFO = 4 [static]`

**6.723.3.2** `Pointer<SessionId> activemq::commands::SessionInfo::sessionId  
[protected]`

The documentation for this class was generated from the following file:

### 6.724.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 3508). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.724.2 Constructor & Destructor Documentation

6.724.2.1 `activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::SessionInfoMarshaller ( ) [inline]`

6.724.2.2 `virtual activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::~~SessionInfoMarshaller ( ) [inline, virtual]`

## 6.724.3 Member Function Documentation

6.724.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.724.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.724.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 801).

**6.724.3.4** `virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 802).

**6.724.3.5** `virtual int activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.724.3.6 virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.724.3.7 virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 806).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/SessionInfoMarshaller.h

### 6.725.3 Member Function Documentation

6.725.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.725.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.725.3.3 **virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

**6.725.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

**6.725.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```
6.725.3.6 virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

```
6.725.3.7 virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

### 6.726.3 Member Function Documentation

6.726.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::createObject** ( )  
 const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.726.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::getDataStructureType**  
 ( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.726.3.3** virtual void **activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseMarshal**  
 ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure**  
 \* *dataStructure*, **decaf::io::DataOutputStream** \* *dataOut* ) throw (  
**decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**  
 (p. 787).

**6.726.3.4** virtual void **activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseUnmarshal**  
 ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure**  
 \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw (  
**decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**  
 (p. 788).

```

6.726.3.5  virtual int activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```

6.726.3.6  virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

6.726.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightUnmarshal ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**SessionInfoMarshaller.h**

## 6.727 activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller Class Reference

### 6.727.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 3521). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.727.2 Constructor & Destructor Documentation

6.727.2.1 **activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::SessionInfoMarshaller**  
( ) [inline]

6.727.2.2 **virtual activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::~~SessionInfoMarshaller**  
( ) [inline, virtual]

### 6.727.3 Member Function Documentation

6.727.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.727.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.727.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

**6.727.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 774).

```
6.727.3.5  virtual int activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 775).

```
6.727.3.6  virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.728 activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller

### Class Reference

3529

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 776).

**6.727.3.7** `virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/SessionInfoMarshaller.h

### 6.728.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 3525). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.728.2 Constructor & Destructor Documentation

6.728.2.1 `activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::SessionInfoMarshaller ( ) [inline]`

6.728.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::~~SessionInfoMarshaller ( ) [inline, virtual]`

## 6.728.3 Member Function Documentation

6.728.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.728.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.728.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 808).

**6.728.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 809).

**6.728.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

**6.728.3.6** `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

**6.728.3.7** `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

The documentation for this class was generated from the following file:

- 6.729.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.729.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

- 6.729.3.3 **virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 780).

**6.729.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 781).

**6.729.3.5** `virtual int activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

**6.729.3.6** virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal2  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure  
 \* *dataStructure*, decaf::io::DataOutputStream \* *dataOut*,  
 utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException )  
 [virtual]

Write a object instance to data output stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

**6.729.3.7** virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightUnmarshal  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream  
 \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i> if an error occurs during the unmarshal.
---

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**SessionInfoMarshaller.h**

**6.730 activemq::cmsutil::SessionPool Class Reference**

A pool of CMS sessions from the same connection and with the same acknowledge mode.

```
#include <src/main/activemq/cmsutil/SessionPool.h>
```

**Public Member Functions**

- **SessionPool** (**cms::Connection** \*connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** \*resourceLifecycleManager)  
*Constructs a session pool.*
- virtual **~SessionPool** ()  
*Destroys the pooled session objects, but not the underlying session resources.*
- virtual **PooledSession** \* **takeSession** () throw ( **cms::CMSEException** )  
*Takes a session from the pool, creating one if necessary.*
- virtual void **returnSession** (**PooledSession** \*session)  
*Returns a session to the pool.*
- **ResourceLifecycleManager** \* **getResourceLifecycleManager** ()

**Protected Member Functions**

- **SessionPool** (const **SessionPool** &)
- **SessionPool** & **operator=** (const **SessionPool** &)

**6.730.1 Detailed Description**

A pool of CMS sessions from the same connection and with the same acknowledge mode. Internal session resources are managed through a provided **ResourceLifecycleManager** (p. 3376), not by this pool. This class is thread-safe.

## 6.730.2 Constructor & Destructor Documentation

**6.730.2.1** `activemq::cmsutil::SessionPool::SessionPool ( const SessionPool & )`  
`[inline, protected]`

**6.730.2.2** `activemq::cmsutil::SessionPool::SessionPool ( cms::Connection * connection, cms::Session::AcknowledgeMode ackMode, ResourceLifecycleManager * resourceLifecycleManager )`

Constructs a session pool.

### Parameters

<i>connection</i>	the connection to be used for creating all sessions.
<i>ackMode</i>	the acknowledge mode to be used for all sessions
<i>resourceLifecycleManager</i>	the object responsible for managing the lifecycle of any allocated <b>cms::Session</b> (p. 3460) resources.

**6.730.2.3** `virtual activemq::cmsutil::SessionPool::~SessionPool ( )` `[virtual]`

Destroys the pooled session objects, but not the underlying session resources.

That is the job of the **ResourceLifecycleManager** (p. 3376).

## 6.730.3 Member Function Documentation

**6.730.3.1** `ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager ( )`  
`[inline]`

**6.730.3.2** `SessionPool& activemq::cmsutil::SessionPool::operator= ( const SessionPool & )`  
`[inline, protected]`

**6.730.3.3** `virtual void activemq::cmsutil::SessionPool::returnSession ( PooledSession * session )` `[virtual]`

Returns a session to the pool.

### Parameters

<i>session</i>	the session to be returned.
----------------	-----------------------------

**6.730.3.4** `virtual PooledSession* activemq::cmsutil::SessionPool::takeSession ( ) throw ( cms::CMSException ) [virtual]`

Takes a session from the pool, creating one if necessary.

#### Returns

the pooled session object

#### Exceptions

<i>cms::CMSException</i> (p. 1190)	if an error occurred
---------------------------------------	----------------------

## 6.732 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

```
#include <src/main/decaf/util/Set.h>
```

Inheritance diagram for decaf::util::Set< E >:

### Public Member Functions

- virtual `~Set()`

#### 6.732.1 Detailed Description

```
template<typename E> class decaf::util::Set< E >
```

A collection that contains no duplicate elements. More formally, sets contain no pair of elements `e1` and `e2` such that `e1 == e2`, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since

1.0

#### 6.732.2 Constructor & Destructor Documentation

6.732.2.1 `template<typename E> virtual decaf::util::Set< E >::~~Set( ) [inline, virtual]`

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Set.h`

## 6.733 decaf::lang::Short Class Reference

```
#include <src/main/decaf/lang/Short.h>
```

Inheritance diagram for decaf::lang::Short:

## Public Member Functions

- **Short** (short value)

*Answers the long value which the receiver represents.*

### Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value) throw ( exceptions::NumberFormatException )  
*Decodes a **String** (p. 3775) into a **Short** (p. 3538).*
- static short **reverseBytes** (short value)  
*Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.*
- static short **parseShort** (const std::string &s, int radix) throw ( exceptions::NumberFormatException )  
*Parses the string argument as a signed short in the radix specified by the second argument.*
- static short **parseShort** (const std::string &s) throw ( exceptions::NumberFormatException )  
*Parses the string argument as a signed decimal short.*
- static **Short valueOf** (short value)  
*Returns a **Short** (p. 3538) instance representing the specified short value.*
- static **Short valueOf** (const std::string &value) throw ( exceptions::NumberFormatException )  
*Returns a **Short** (p. 3538) object holding the value given by the specified std::string.*
- static **Short valueOf** (const std::string &value, int radix) throw ( exceptions::NumberFormatException )  
*Returns a **Short** (p. 3538) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

### Static Public Attributes

- static const int **SIZE** = 16  
*Size of this objects primitive type in bits.*
- static const short **MAX\_VALUE** = (short)0x7FFF  
*Max Value for this Object's primitive type.*
- static const short **MIN\_VALUE** = (short)0x8000  
*Max Value for this Object's primitive type.*

## 6.733.1 Constructor & Destructor Documentation

### 6.733.1.1 decaf::lang::Short::Short ( short *value* )

#### Parameters

<i>value</i>	- short to wrap
--------------	-----------------

### 6.733.1.2 decaf::lang::Short::Short ( const std::string & *value* ) throw ( exceptions::NumberFormatException )

#### Parameters

<i>value</i>	- string value to convert to short and wrap
--------------	---

#### Exceptions

<i>NumberFormatException</i>	
------------------------------	--

### 6.733.1.3 virtual decaf::lang::Short::~~Short ( ) [inline, virtual]

## 6.733.2 Member Function Documentation

### 6.733.2.1 virtual unsigned char decaf::lang::Short::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

#### Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2919).

### 6.733.2.2 virtual int decaf::lang::Short::compareTo ( const short & *s* ) const [virtual]

Compares this **Short** (p. 3538) instance with another.

#### Parameters

<i>s</i>	- the <b>Short</b> (p. 3538) instance to be compared
----------	--

#### Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **short** > (p. 1249).

**6.733.2.3** `virtual int decaf::lang::Short::compareTo ( const Short & s ) const` [virtual]

Compares this **Short** (p. 3538) instance with another.

#### Parameters

<i>s</i>	- the <b>Short</b> (p. 3538) instance to be compared
----------	--

#### Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Short** > (p. 1249).

**6.733.2.4** `static Short decaf::lang::Short::decode ( const std::string & value ) throw ( exceptions::NumberFormatException )` [static]

Decodes a **String** (p. 3775) into a **Short** (p. 3538).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p. 3545) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a **NumberFormatException** will be thrown. The result is negated if first character of the specified **String** (p. 3775) is the minus sign. No whitespace characters are permitted in the string.

#### Parameters

<i>value</i>	- The string to decode
--------------	------------------------

#### Returns

a **Short** (p. 3538) object containing the decoded value

#### Exceptions

<i>NumberFormatException</i>	if the string is not formatted correctly.
------------------------------	---

**6.733.2.5** `virtual double decaf::lang::Short::doubleValue ( ) const` [inline, virtual]

Answers the double value which the receiver represents.

**Returns**

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2919).

**6.733.2.6** `bool decaf::lang::Short::equals ( const Short & s ) const` `[inline, virtual]`

**Returns**

true if the two **Short** (p. 3538) Objects have the same value.

Implements **decaf::lang::Comparable< Short >** (p. 1250).

**6.733.2.7** `bool decaf::lang::Short::equals ( const short & s ) const` `[inline, virtual]`

**Returns**

true if the two **Short** (p. 3538) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p. 1250).

**6.733.2.8** `virtual float decaf::lang::Short::floatValue ( ) const` `[inline, virtual]`

Answers the float value which the receiver represents.

**Returns**

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

**6.733.2.9** `virtual int decaf::lang::Short::intValue ( ) const` `[inline, virtual]`

Answers the int value which the receiver represents.

**Returns**

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

**6.733.2.10** `virtual long long decaf::lang::Short::longValue ( ) const` `[inline, virtual]`

Answers the long value which the receiver represents.

**Returns**

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2920).

**6.733.2.11** `virtual bool decaf::lang::Short::operator< ( const Short & s ) const` `[inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

**Parameters**

<code>s</code>	- the value to be compared to this one.
----------------	---

**Returns**

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Short >** (p. 1250).

**6.733.2.12** `virtual bool decaf::lang::Short::operator< ( const short & s ) const` `[inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

**Parameters**

<code>s</code>	- the value to be compared to this one.
----------------	---

**Returns**

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p. 1250).

**6.733.2.13** `virtual bool decaf::lang::Short::operator== ( const Short & s ) const` `[inline, virtual]`

Compares equality between this object and the one passed.

**Parameters**

<code>s</code>	- the value to be compared to this one.
----------------	---

**Returns**

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Short** > (p. 1250).

**6.733.2.14** `virtual bool decaf::lang::Short::operator==( const short & s ) const` [inline, virtual]

Compares equality between this object and the one passed.

**Parameters**

<i>s</i>	- the value to be compared to this one.
----------	---

**Returns**

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **short** > (p. 1250).

**6.733.2.15** `static short decaf::lang::Short::parseShort ( const std::string & s, int radix ) throw ( exceptions::NumberFormatException )` [static]

Parses the string argument as a signed short in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 1130) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type **NumberFormatException** is thrown if any of the following situations occurs: \* The first argument is null or is a string of length zero. \* The radix is either smaller than **Character.MIN\_RADIX** (p. 1134) or larger than **Character.MAX\_RADIX** (p. 1134). \* Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. \* The value represented by the string is not a value of type short.

**Parameters**

<i>s</i>	- the <b>String</b> (p. 3775) containing the short representation to be parsed
<i>radix</i>	- the radix to be used while parsing s

**Returns**

the short represented by the string argument in the specified radix.

**Exceptions**

<i>NumberFormatException</i>	- If <b>String</b> (p. 3775) does not contain a parsable short.
------------------------------	---

**6.733.2.16** `static short decaf::lang::Short::parseShort ( const std::string & s ) throw ( exceptions::NumberFormatException )` [static]

Parses the string argument as a signed decimal short.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseShort( const std::string, int )` method.

#### Parameters

<i>s</i>	- <b>String</b> (p. 3775) to convert to a short
----------	---

#### Returns

the converted short value

#### Exceptions

<i>NumberFormatException</i>	if the string is not a short.
------------------------------	-------------------------------

**6.733.2.17** `static short decaf::lang::Short::reverseBytes ( short value )` [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

#### Parameters

<i>value</i>	- the short whose bytes we are to reverse
--------------	---

#### Returns

the reversed short.

**6.733.2.18** `virtual short decaf::lang::Short::shortValue ( ) const` [inline, virtual]

Answers the short value which the receiver represents.

#### Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2920).

**6.733.2.19** `static std::string decaf::lang::Short::toString ( short value )` [static]

#### Returns

a string representing the primitive value as Base 10

**6.733.2.20** `std::string decaf::lang::Short::toString ( ) const`**Returns**

this **Short** (p. 3538) Object as a **String** (p. 3775) Representation

**6.733.2.21** `static Short decaf::lang::Short::valueOf ( short value ) [static]`

Returns a **Short** (p. 3538) instance representing the specified short value.

**Parameters**

<i>value</i>	- the short to wrap
--------------	---------------------

**Returns**

the new **Short** (p. 3538) object wrapping value.

**6.733.2.22** `static Short decaf::lang::Short::valueOf ( const std::string & value ) throw ( exceptions::NumberFormatException ) [static]`

Returns a **Short** (p. 3538) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the `parseShort( std::string )` method. The result is a **Short** (p. 3538) object that represents the short value specified by the string.

**Parameters**

<i>value</i>	- std::string to parse as base 10
--------------	-----------------------------------

**Returns**

new **Short** (p. 3538) Object wrapping the primitive

**Exceptions**

<i>NumberFormatException</i>	if the string is not a decimal short.
------------------------------	---------------------------------------

**6.733.2.23** `static Short decaf::lang::Short::valueOf ( const std::string & value, int radix ) throw ( exceptions::NumberFormatException ) [static]`

Returns a **Short** (p. 3538) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the `parseShort( std::string, int )` method. The result is a **Short** (p. 3538) object that represents the short

value specified by the string.

Parameters

<i>value</i>	- std::string to parse as base ( radix )
<i>radix</i>	- base of the string to parse.

Returns

new **Short** (p. 3538) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i>	if the string is not a valid short.
------------------------------	-------------------------------------

6.733.3 Field Documentation

6.733.3.1 `const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF` [static]

Max Value for this Object's primitive type.

6.733.3.2 `const short decaf::lang::Short::MIN_VALUE = (short)0x8000` [static]

Max Value for this Object's primitive type.

6.733.3.3 `const int decaf::lang::Short::SIZE = 16` [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/Short.h

6.734 decaf::internal::nio::ShortArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (int size, bool readOnly=false) throw ( decaf::lang::exceptions::IllegalArgumentExcep )

Creates a **ShortArrayBuffer** (p. 3548) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

- **ShortArrayBuffer** (short \*array, int size, int offset, int length, bool readOnly=false) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

Creates a **ShortArrayBuffer** (p. 3548) object that wraps the given array.

- **ShortArrayBuffer** (const decaf::lang::Pointer< ByteArrayAdapter > &array, int offset, int length, bool readOnly=false) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **ShortArrayBuffer** (const ShortArrayBuffer &other)

Create a **ShortArrayBuffer** (p. 3548) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

- virtual ~**ShortArrayBuffer** ()
- virtual short \* **array** () throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException )

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

#### Returns

the array that backs this **Buffer** (p. 936)

#### Exceptions

<b>ReadOnlyBufferException</b> (p. 3260)	if this <b>Buffer</b> (p. 936) is read only.
UnsupportedOperationException	if the underlying store has no array.

- virtual int **arrayOffset** () throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException )

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

#### Returns

The offset into the backing array where index zero starts.

#### Exceptions

<b>ReadOnlyBufferException</b> (p. 3260)	if this <b>Buffer</b> (p. 936) is read only.
---	--

UnsupportedOperation Exception	if the underlying store has no array.
-----------------------------------	---------------------------------------

- virtual ShortBuffer \* **asReadOnlyBuffer** () const

*Creates a new, read-only short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent. If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method. The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.*

#### Returns

*The new, read-only short buffer which the caller then owns.*

- virtual ShortBuffer & **compact** () throw ( decaf::nio::ReadOnlyBufferException )

*Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index  $p = \text{position}()$  (p. 941) is copied to index zero, the byte at index  $p + 1$  is copied to index one, and so forth until the byte at index  $\text{limit}()$  (p. 940) - 1 is copied to index  $n = \text{limit}()$  (p. 940) - 1 -  $p$ . The buffer's position is then set to  $n+1$  and its limit is set to its capacity. The mark, if defined, is discarded. The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.*

#### Returns

*a reference to this **ShortBuffer** (p. 3560).*

#### Exceptions

<b>ReadOnlyBufferException</b> (p. 3260)	if this buffer is read-only.
---	------------------------------

- virtual ShortBuffer \* **duplicate** ()

*Creates a new short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent. The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.*

#### Returns

*a new short **Buffer** (p. 936) which the caller owns.*

- virtual short **get** () throw ( decaf::nio::BufferUnderflowException )

*Relative get method.*

*Reads the value at this buffer's current position, and then increments the position.*

**Returns**

*the short at the current position.*

**Exceptions**

<b>BufferUnderflowException</b> (p. 967)	<i>if there no more data to return.</i>
---	---

- virtual short **get** (int index) const throw ( lang::exceptions::IndexOutOfBoundsException )

*Absolute get method.*

*Reads the value at the given index.*

**Parameters**

index	<i>The index in the <b>Buffer</b> (p. 936) where the short is to be read.</i>
-------	---

**Returns**

*the short that is located at the given index.*

**Exceptions**

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or the index is negative.</i>
---------------------------	---

- virtual bool **hasArray** () const

*Tells whether or not this buffer is backed by an accessible short array.*

*If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.*

**Returns**

*true if, and only if, this buffer is backed by an array and is not read-only.*

- virtual bool **isReadOnly** () const

*Tells whether or not this buffer is read-only.*

**Returns**

*true if, and only if, this buffer is read-only.*

- virtual ShortBuffer & **put** (short value) throw ( decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException )

*Writes the given shorts into this buffer at the current position, and then increments the position.*

**Parameters**

value	<i>The shorts value to be written.</i>
-------	--

**Returns**

*a reference to this buffer.*

*Exceptions*

<b>BufferOverflowException</b> (p. 964)	<i>if this buffer's current position is not smaller than its limit.</i>
<b>ReadOnlyBufferException</b> (p. 3260)	<i>if this buffer is read-only.</i>

- virtual ShortBuffer & **put** (int index, short value) throw ( lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException )

*Writes the given shorts into this buffer at the given index.*

*Parameters*

index	<i>The position in the <b>Buffer</b> (p. 936) to write the data.</i>
value	<i>The shorts to write.</i>

*Returns*

*a reference to this buffer.*

*Exceptions*

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written.</i>
<b>ReadOnlyBufferException</b> (p. 3260)	<i>if this buffer is read-only.</i>

- virtual ShortBuffer \* **slice** () const

*Creates a new **ShortBuffer** (p. 3560) whose content is a shared subsequence of this buffer's content.*

*The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.*

*The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.*

*Returns*

*the newly create **ShortBuffer** (p. 3560) which the caller owns.*

**Protected Member Functions**

- virtual void **setReadOnly** (bool value)

*Sets this **ShortArrayBuffer** (p. 3548) as Read-Only.*

### 6.734.1 Constructor & Destructor Documentation

**6.734.1.1** `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer ( int size, bool readOnly = false ) throw ( decaf::lang::exceptions::IllegalArgumentException )`

Creates a **ShortArrayBuffer** (p. 3548) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

#### Parameters

<i>size</i>	The size of the array, this is the limit we read and write to.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

#### Exceptions

<i>IllegalArgumentException</i>	if the capacity value is negative.
---------------------------------	------------------------------------

**6.734.1.2** `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer ( short * array, int size, int offset, int length, bool readOnly = false ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )`

Creates a **ShortArrayBuffer** (p. 3548) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

#### Parameters

<i>array</i>	The actual array to wrap.
<i>size</i>	The size of the given array.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

#### Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

```

6.734.1.3  decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (
            const decaf::lang::Pointer< ByteArrayAdapter >
            & array, int offset, int length, bool readOnly = false )
            throw ( decaf::lang::exceptions::NullPointerException,
            decaf::lang::exceptions::IndexOutOfBoundsException )

```

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **ShortArrayBuffer** (p.3548) will be that of the remaining capacity of the passed buffer.

#### Parameters

<i>array</i>	The ByteArrayAdapter to wrap.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

#### Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset + length is greater than array size.

```

6.734.1.4  decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer ( const ShortArrayBuffer
            & other )

```

Create a **ShortArrayBuffer** (p. 3548) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

#### Parameters

<i>other</i>	The <b>ShortArrayBuffer</b> (p. 3548) this one is to mirror.
--------------	--

```

6.734.1.5  virtual decaf::internal::nio::ShortArrayBuffer::~ShortArrayBuffer ( )
            [virtual]

```

#### 6.734.2 Member Function Documentation

```

6.734.2.1  virtual short* decaf::internal::nio::ShortArrayBuffer::array ( ) throw
            ( decaf::lang::exceptions::UnsupportedOperationException,
            decaf::nio::ReadOnlyBufferException ) [virtual]

```

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

### Returns

the array that backs this **Buffer** (p. 936)

### Exceptions

<i><b>ReadOnlyBufferException</b></i> (p. 3260)	if this <b>Buffer</b> (p. 936) is read only.
<i><b>UnsupportedOperationException</b></i>	if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 3563).

**6.734.2.2** `virtual int decaf::internal::nio::ShortArrayBuffer::arrayOffset ( ) throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException ) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

### Returns

The offset into the backing array where index zero starts.

### Exceptions

<i><b>ReadOnlyBufferException</b></i> (p. 3260)	if this <b>Buffer</b> (p. 936) is read only.
<i><b>UnsupportedOperationException</b></i>	if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 3564).

**6.734.2.3** `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer ( ) const [virtual]`

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and

will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

### Returns

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 3564).

**6.734.2.4** `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact ( ) throw ( decaf::nio::ReadOnlyBufferException )` [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index  $p = \text{position}()$  (p. 941) is copied to index zero, the byte at index  $p + 1$  is copied to index one, and so forth until the byte at index  $\text{limit}()$  (p. 940) - 1 is copied to index  $n = \text{limit}()$  (p. 940) - 1 -  $p$ . The buffer's position is then set to  $n+1$  and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

### Returns

a reference to this **ShortBuffer** (p. 3560).

### Exceptions

<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this buffer is read-only.
--	------------------------------

Implements **decaf::nio::ShortBuffer** (p. 3565).

**6.734.2.5** `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate ( )` [virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

### Returns

a new short **Buffer** (p. 936) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 3565).

**6.734.2.6** virtual short decaf::internal::nio::ShortArrayBuffer::get ( ) throw ( decaf::nio::BufferUnderflowException ) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

### Returns

the short at the current position.

### Exceptions

<i>BufferUnderflowException</i> (p. 967)	if there no more data to return.
---	----------------------------------

Implements **decaf::nio::ShortBuffer** (p. 3567).

**6.734.2.7** virtual short decaf::internal::nio::ShortArrayBuffer::get ( int index ) const throw ( lang::exceptions::IndexOutOfBoundsException ) [virtual]

Absolute get method.

Reads the value at the given index.

### Parameters

<i>index</i>	The index in the <b>Buffer</b> (p. 936) where the short is to be read.
--------------	--

### Returns

the short that is located at the given index.

### Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or the index is negative.
----------------------------------	--

Implements **decaf::nio::ShortBuffer** (p. 3566).

**6.734.2.8** `virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray ( ) const` `[inline, virtual]`

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

#### Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ShortBuffer** (p. 3568).

**6.734.2.9** `virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly ( ) const` `[inline, virtual]`

Tells whether or not this buffer is read-only.

#### Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 940).

**6.734.2.10** `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put ( int index, short value ) throw ( lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException )` `[virtual]`

Writes the given shorts into this buffer at the given index.

#### Parameters

<i>index</i>	The position in the <b>Buffer</b> (p. 936) to write the data.
<i>value</i>	The shorts to write.

#### Returns

a reference to this buffer.

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 3569).

**6.734.2.11** `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put ( short value ) throw ( decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException )` [virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

#### Parameters

<i>value</i>	The shorts value to be written.
--------------	---------------------------------

#### Returns

a reference to this buffer.

#### Exceptions

<b><i>BufferOverflowException</i></b> (p. 964)	if this buffer's current position is not smaller than its limit.
<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 3568).

**6.734.2.12** `virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly ( bool value )`  
[inline, protected, virtual]

Sets this **ShortArrayBuffer** (p. 3548) as Read-Only.

#### Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

**6.734.2.13** `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice ( ) const`  
[virtual]

Creates a new **ShortBuffer** (p. 3560) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

**Returns**

the newly create **ShortBuffer** (p. 3560) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 3571).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ShortArrayBuffer.h**

**6.735 decaf::nio::ShortBuffer Class Reference**

This class defines four categories of operations upon short buffers:

```
#include <src/main/decaf/nio/ShortBuffer.h>
```

Inheritance diagram for decaf::nio::ShortBuffer:

**Public Member Functions**

### Protected Member Functions

- **ShortBuffer** (int capacity) throw ( decaf::lang::exceptions::IllegalArgumentException )

*Creates a **ShortBuffer** (p. 3560) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

#### 6.735.1 Detailed Description

This class defines four categories of operations upon short buffers: o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

## 6.735.2 Constructor & Destructor Documentation

**6.735.2.1** `decaf::nio::ShortBuffer::ShortBuffer ( int capacity ) throw ( decaf::lang::exceptions::IllegalArgumentException ) [protected]`

Creates a **ShortBuffer** (p. 3560) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

### Parameters

<i>capacity</i>	The size and limit of the <b>Buffer</b> (p. 936) in doubles
-----------------	---

### Exceptions

<i>IllegalArgumentEx-ception</i>	if capacity is negative.
----------------------------------	--------------------------

**6.735.2.2** `virtual decaf::nio::ShortBuffer::~~ShortBuffer ( ) [inline, virtual]`

## 6.735.3 Member Function Documentation

**6.735.3.1** `static ShortBuffer* decaf::nio::ShortBuffer::allocate ( int capacity ) throw ( decaf::lang::exceptions::IllegalArgumentException ) [static]`

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

### Parameters

<i>capacity</i>	The size of the Double buffer in shorts.
-----------------	--

### Returns

the **ShortBuffer** (p. 3560) that was allocated, caller owns.

**6.735.3.2** `virtual short* decaf::nio::ShortBuffer::array ( ) throw ( decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException ) [pure virtual]`

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

**Returns**

the array that backs this **Buffer** (p. 936)

**Exceptions**

<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this <b>Buffer</b> (p. 936) is read only.
<b><i>UnsupportedOperationException</i></b>	if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3554).

**6.735.3.3** `virtual int decaf::nio::ShortBuffer::arrayOffset ( ) throw ( decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException ) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

**Returns**

The offset into the backing array where index zero starts.

**Exceptions**

<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this <b>Buffer</b> (p. 936) is read only.
<b><i>UnsupportedOperationException</i></b>	if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3555).

**6.735.3.4** `virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer ( ) const [pure virtual]`

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

### Returns

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3555).

**6.735.3.5** `virtual ShortBuffer& decaf::nio::ShortBuffer::compact ( ) throw ( ReadOnlyBufferException )` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index  $p = \text{position}()$  (p. 941) is copied to index zero, the byte at index  $p + 1$  is copied to index one, and so forth until the byte at index  $\text{limit}()$  (p. 940) - 1 is copied to index  $n = \text{limit}()$  (p. 940) - 1 -  $p$ . The buffer's position is then set to  $n+1$  and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

### Returns

a reference to this **ShortBuffer** (p. 3560).

### Exceptions

<b>ReadOnlyBufferException</b> (p. 3260)	if this buffer is read-only.
---	------------------------------

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3556).

**6.735.3.6** `virtual int decaf::nio::ShortBuffer::compareTo ( const ShortBuffer & value ) const` [virtual]

**6.735.3.7** `virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate ( )` [pure virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

**Returns**

a new short **Buffer** (p. 936) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3556).

**6.735.3.8** `virtual bool decaf::nio::ShortBuffer::equals ( const ShortBuffer & value ) const`  
[virtual]

**6.735.3.9** `ShortBuffer& decaf::nio::ShortBuffer::get ( std::vector< short > buffer ) throw ( BufferUnderflowException )`

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize( N )` before calling this get method.

**Returns**

a reference to this **Buffer** (p. 936).

**Exceptions**

<i><b>BufferUnderflowException</b></i> (p. 967)	if there are fewer than length shorts remaining in this buffer.
--	---

**6.735.3.10** `virtual short decaf::nio::ShortBuffer::get ( int index ) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException )` [pure virtual]

Absolute get method.

Reads the value at the given index.

**Parameters**

<i>index</i>	The index in the <b>Buffer</b> (p. 936) where the short is to be read.
--------------	--

**Returns**

the short that is located at the given index.

**Exceptions**

<i><b>IndexOutOfBoundsException</b></i>	if index is not smaller than the buffer's limit, or the index is negative.
---	--

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3557).

**6.735.3.11 ShortBuffer& decaf::nio::ShortBuffer::get ( short \* *buffer*, int *size*, int *offset*, int *length* ) throw ( BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )**

Relative bulk get method.

This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 941), then no bytes are transferred and a **BufferUnderflowException** (p. 967) is thrown.

Otherwise, this method copies `length` shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

#### Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the buffer provided.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

#### Returns

a reference to this **Buffer** (p. 936).

#### Exceptions

<b>BufferUnderflowException</b> (p. 967)	if there are fewer than <code>length</code> shorts remaining in this buffer
<b>NullPointerException</b>	if the passed buffer is null.
<b>IndexOutOfBoundsException</b>	if the preconditions of <code>size</code> , <code>offset</code> , or <code>length</code> are not met.

**6.735.3.12 virtual short decaf::nio::ShortBuffer::get ( ) throw ( BufferUnderflowException ) [pure virtual]**

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

#### Returns

the short at the current position.

**Exceptions**

<b><i>BufferUnderflowException</i></b> (p. 967)	if there no more data to return.
--	----------------------------------

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3557).

**6.735.3.13** `virtual bool decaf::nio::ShortBuffer::hasArray ( ) const` [pure virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

**Returns**

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3558).

**6.735.3.14** `virtual bool decaf::nio::ShortBuffer::operator< ( const ShortBuffer & value ) const` [virtual]

**6.735.3.15** `virtual bool decaf::nio::ShortBuffer::operator== ( const ShortBuffer & value ) const` [virtual]

**6.735.3.16** `virtual ShortBuffer& decaf::nio::ShortBuffer::put ( short value ) throw ( BufferOverflowException, ReadOnlyBufferException )` [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

**Parameters**

<i>value</i>	The shorts value to be written.
--------------	---------------------------------

**Returns**

a reference to this buffer.

**Exceptions**

<b><i>BufferOverflowException</i></b> (p. 964)	if this buffer's current position is not smaller than its limit.
<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3559).

**6.735.3.17** virtual **ShortBuffer&** **decaf::nio::ShortBuffer::put** ( int *index*, short *value* ) throw ( **decaf::lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException** ) [pure virtual]

Writes the given shorts into this buffer at the given index.

#### Parameters

<i>index</i>	The position in the <b>Buffer</b> (p. 936) to write the data.
<i>value</i>	The shorts to write.

#### Returns

a reference to this buffer.

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written.
<i>ReadOnlyBufferException</i> (p. 3260)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3558).

**6.735.3.18** **ShortBuffer&** **decaf::nio::ShortBuffer::put** ( const short \* *buffer*, int *size*, int *offset*, int *length* ) throw ( **BufferOverflowException**, **ReadOnlyBufferException**, **decaf::lang::exceptions::IndexOutOfBoundsException**, **decaf::lang::exceptions::NullPointerException** )

This method transfers shorts into this buffer from the given source array.

If there are more shorts to be copied from the array than remain in this buffer, that is, if *length* > **remaining()** (p. 941), then no shorts are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies *length* bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by *length*.

#### Parameters

<i>buffer</i>	The array from which shorts are to be read.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The offset within the array of the first char to be read.
<i>length</i>	The number of shorts to be read from the given array.

**Returns**

a reference to this buffer.

**Exceptions**

<b><i>BufferOverflowException</i></b> (p. 964)	if there is insufficient space in this buffer
<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this buffer is read-only
<b><i>NullPointerException</i></b>	if the passed buffer is null.
<b><i>IndexOutOfBoundsException</i></b>	if the preconditions of size, offset, or length are not met.

#### 6.735.3.19 **ShortBuffer& decaf::nio::ShortBuffer::put ( std::vector< short > & buffer ) throw ( BufferOverflowException, ReadOnlyBufferException )**

This method transfers the entire content of the given source shorts array into this buffer.

This is the same as calling put( &buffer[0], 0, buffer.size()).

**Parameters**

<i>buffer</i>	The buffer whose contents are copied to this <b>ShortBuffer</b> (p. 3560).
---------------	--

**Returns**

a reference to this buffer.

**Exceptions**

<b><i>BufferOverflowException</i></b> (p. 964)	if there is insufficient space in this buffer.
<b><i>ReadOnlyBufferException</i></b> (p. 3260)	if this buffer is read-only.

#### 6.735.3.20 **ShortBuffer& decaf::nio::ShortBuffer::put ( ShortBuffer & src ) throw ( BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException )**

This method transfers the shorts remaining in the given source buffer into this buffer.

If there are more shorts remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 941), then no shorts are transferred and a **BufferOverflowException** (p. 964) is thrown.

Otherwise, this method copies  $n = \text{src.remaining}()$  shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by  $n$ .

### Parameters

<i>src</i>	The buffer to take shorts from an place in this one.
------------	--

### Returns

a reference to this buffer.

### Exceptions

<b><i>BufferOverflowException</i></b> (p. 964)	if there is insufficient space in this buffer for the remaining shorts in the source buffer.
<b><i>IllegalArgumentEx-ception</i></b>	if the source buffer is this buffer.
<b><i>ReadOnlyBufferEx-ception</i></b> (p. 3260)	if this buffer is read-only.

**6.735.3.21** `virtual ShortBuffer* decaf::nio::ShortBuffer::slice ( ) const` [pure virtual]

Creates a new **ShortBuffer** (p. 3560) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

### Returns

the newly create **ShortBuffer** (p. 3560) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3559).

**6.735.3.22** `virtual std::string decaf::nio::ShortBuffer::toString ( ) const` [virtual]

### Returns

a std::string describing this object

**6.735.3.23** `static ShortBuffer* decaf::nio::ShortBuffer::wrap ( short * array, int size, int offset, int length ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException ) [static]`

Wraps the passed buffer with a new **ShortBuffer** (p. 3560).

The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

#### Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the passed in array.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

#### Returns

a new **ShortBuffer** (p. 3560) that is backed by buffer, caller owns.

#### Exceptions

<i>NullPointerException</i>	if the array pointer is NULL.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

**6.735.3.24** `static ShortBuffer* decaf::nio::ShortBuffer::wrap ( std::vector< short > & buffer ) [static]`

Wraps the passed STL short Vector in a **ShortBuffer** (p. 3560).

The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

#### Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize( N )</code> .
---------------	--

#### Returns

a new **ShortBuffer** (p. 3560) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/ShortBuffer.h`

## 6.736 activemq::commands::ShutdownInfo Class Reference

```
#include <src/main/activemq/commands/ShutdownInfo.h>
```

Inheritance diagram for activemq::commands::ShutdownInfo:

### Public Member Functions

- **ShutdownInfo** ()
- virtual **~ShutdownInfo** ()
- virtual unsigned char **getDataStructureType** () const  
*Get the unique identifier that this object and its own Marshaler share.*
- virtual **ShutdownInfo** \* **cloneDataStructure** () const  
*Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.*
- virtual void **copyDataStructure** (const **DataStructure** \*src)  
*Copy the contents of the passed object into this object's members, overwriting any existing data.*
- virtual std::string **toString** () const  
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** \*value) const  
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual bool **isShutdownInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor \*visitor) throw ( exceptions::ActiveMQException )  
*Allows a Visitor to visit this command and return a response to the command based on the command type being visited.*

### Static Public Attributes

- static const unsigned char **ID\_SHUTDOWNINFO** = 11

## 6.736.1 Constructor & Destructor Documentation

6.736.1.1 `activemq::commands::ShutdownInfo::ShutdownInfo ( )`

6.736.1.2 `virtual activemq::commands::ShutdownInfo::~~ShutdownInfo ( ) [virtual]`

## 6.736.2 Member Function Documentation

6.736.2.1 `virtual ShutdownInfo* activemq::commands::ShutdownInfo::cloneDataStructure ( ) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.736.2.2 `virtual void activemq::commands::ShutdownInfo::copyDataStructure ( const DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.736.2.3 `virtual bool activemq::commands::ShutdownInfo::equals ( const DataStructure * value ) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

### Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

**6.736.2.4** `virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSet** (p. 1713) type copy.

Implements **activemq::commands::DataSet** (p. 1717).

**6.736.2.5** `virtual bool activemq::commands::ShutdownInfo::isShutdownInfo ( ) const [inline, virtual]`

#### Returns

an answer of true to the **isShutdownInfo()** (p. 3575) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.736.2.6** `virtual std::string activemq::commands::ShutdownInfo::toString ( ) const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.736.2.7** `virtual Pointer<Command> activemq::commands::ShutdownInfo::visit ( activemq::state::CommandVisitor * visitor ) throw ( exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.736.3 Field Documentation

6.736.3.1 `const unsigned char activemq::commands::ShutdownInfo::ID_SHUTDOWNINFO = 11` [static]

The documentation for this class was generated from the following file:

### 6.737.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3576). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.737.2 Constructor & Destructor Documentation

**6.737.2.1** **activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::ShutdownInfoMarshaller**  
( ) [inline]

**6.737.2.2** **virtual activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller**  
( ) [inline, virtual]

### 6.737.3 Member Function Documentation

**6.737.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.737.3.2** **virtual unsigned char activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

```
6.737.3.3  virtual void activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 801).

```
6.737.3.4  virtual void activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 802).

6.737.3.5 virtual int activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::tightMarshal1  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException )  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller**  
(p. 803).

6.737.3.6 virtual void activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::tightMarshal2  
( OpenWireFormat \* *wireFormat*, commands::DataStructure  
\* *dataStructure*, decaf::io::DataOutputStream \* *dataOut*,  
utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException )  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller**  
(p. 804).

```

6.737.3.7 virtual void activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 806).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/**ShutdownInfoMarshaller.h**

## 6.738 activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3580).

### 6.738.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3580). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.738.2 Constructor & Destructor Documentation

**6.738.2.1** **activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::ShutdownInfoMarshaller**  
( ) [inline]

**6.738.2.2** **virtual activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller**  
( ) [inline, virtual]

### 6.738.3 Member Function Documentation

**6.738.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.738.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.738.3.3** `virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

**6.738.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

**6.738.3.5** `virtual int activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

**6.738.3.6** `virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

**6.738.3.7** `virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

### 6.739.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3584). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.739.2 Constructor & Destructor Documentation

6.739.2.1 `activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::ShutdownInfoMarshaller ( )` `[inline]`

6.739.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller ( )` `[inline, virtual]`

## 6.739.3 Member Function Documentation

6.739.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::createObject ( )`  
`const` `[virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.739.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::getDataStructureType ( )` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.739.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut )` `throw ( decaf::io::IOException )` `[virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

**6.739.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

**6.739.3.5** `virtual int activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

## Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

## Returns

int value indicating the size of the marshaled object.

## Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 789).

```
6.739.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 790).

```
6.739.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/ShutdownInfoMarshaller.h

## 6.740 activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller Class Reference

### 6.740.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3589). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.740.2 Constructor & Destructor Documentation

6.740.2.1 **activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::ShutdownInfoMarshaller**  
( ) [inline]

6.740.2.2 **virtual activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller**  
( ) [inline, virtual]

### 6.740.3 Member Function Documentation

6.740.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.740.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::getDataStructureType**  
( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.740.3.3 **virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseMarshal**  
( **OpenWireFormat \* wireFormat**, **commands::DataStructure \* dataStructure**, **decaf::io::DataOutputStream \* dataOut** ) **throw** ( **decaf::io::IOException** ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 794).

**6.740.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

**6.740.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 796).

```
6.740.3.6  virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 797).

```
6.740.3.7  virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

## Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

### 6.741.3 Member Function Documentation

- 6.741.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::createObject** ( )  
**const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

- 6.741.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::getDataStructureType**  
 ( ) **const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

## 6.741 activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller

### Class Reference 3599

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.741.3.3** `virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException )` [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 772).

**6.741.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 774).

```
6.741.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```
6.741.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

## 6.742 activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller

### Class Reference

3601

6.741.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightUnmarshal ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 777).

The documentation for this class was generated from the following file:

### 6.742.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3597). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.742.2 Constructor & Destructor Documentation

6.742.2.1 **activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::ShutdownInfoMarshaller** ( ) [inline]

6.742.2.2 **virtual activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller** ( ) [inline, virtual]

### 6.742.3 Member Function Documentation

6.742.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::createObject** ( ) const [virtual]

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.742.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::getDataStructureType ( ) const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.742.3.3** `virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException )` [virtual]

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

**6.742.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )` [virtual]

Un-marshall an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```
6.742.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 782).

```
6.742.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 783).

**6.742.3.7** virtual void **activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

The documentation for this class was generated from the following file:

- virtual **~SignatureException** () throw ()

## 6.743.1 Constructor & Destructor Documentation

6.743.1.1 **decaf::security::SignatureException::SignatureException ( ) throw ()** [inline]

Default Constructor.

6.743.1.2 **decaf::security::SignatureException::SignatureException ( const Exception & ex ) throw ()** [inline]

Conversion Constructor from some other Exception.

### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.743.1.3 **decaf::security::SignatureException::SignatureException ( const SignatureException & ex ) throw ()** [inline]

Copy Constructor.

**Parameters**

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.743.1.4** decaf::security::SignatureException::SignatureException ( const char \* *file*, const int *lineNumber*, const std::exception \* *cause*, const char \* *msg*, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.  
Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.743.1.5** decaf::security::SignatureException::SignatureException ( const std::exception \* *cause* ) throw () [inline]

Constructor.

**Parameters**

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.743.1.6** decaf::security::SignatureException::SignatureException ( const char \* *file*, const int *lineNumber*, const char \* *msg*, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.  
Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
...	list of primitives that are formatted into the message

**6.743.1.7** `virtual decaf::security::SignatureException::~~SignatureException ( ) throw ()`  
`[inline, virtual]`

## 6.743.2 Member Function Documentation

**6.743.2.1** `virtual SignatureException* decaf::security::SignatureException::clone ( ) const`  
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

### Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 2037).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/SignatureException.h`

## 6.744 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 2487) in a human readable format.

```
#include <src/main/decaf/util/logging/SimpleFormatter.h>
```

Inheritance diagram for `decaf::util::logging::SimpleFormatter`:

### Public Member Functions

- **SimpleFormatter** ()
- virtual **~SimpleFormatter** ()
- virtual `std::string format (const LogRecord &record) const`

*Format the given log record and return the formatted string.*

### 6.744.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 2487) in a human readable format. The summary will typically be 1 or 2 lines.

### Since

1.0

## 6.744.2 Constructor & Destructor Documentation

6.744.2.1 decaf::util::logging::SimpleFormatter::SimpleFormatter ( )

6.744.2.2 virtual decaf::util::logging::SimpleFormatter::~SimpleFormatter ( ) [virtual]

## 6.744.3 Member Function Documentation

6.744.3.1 virtual std::string decaf::util::logging::SimpleFormatter::format ( const **LogRecord** & *record* ) const [virtual]

Format the given log record and return the formatted string.

### Parameters

<i>record</i>	The Log Record to Format.
---------------	---------------------------

Implements **decaf::util::logging::Formatter** (p. 2028).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**SimpleFormatter.h**

## 6.745 decaf::util::logging::SimpleLogger Class Reference

- virtual void **bind** (const std::string &ipaddress, int port) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException )  
*Binds this **Socket** (p. 3607) to the given local address and port.*
- virtual void **close** () throw ( decaf::io::IOException )  
*Closes the **Socket** (p. 3607).*
- virtual void **connect** (const std::string &host, int port) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException )  
*Connects to the specified destination.*
- virtual void **connect** (const std::string &host, int port, int timeout) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException )  
*Connects to the specified destination, with a specified timeout value.*
- bool **isConnected** () const  
*Indicates whether or not this socket is connected to an end point.*
- bool **isClosed** () const
- bool **isBound** () const
- bool **isInputShutdown** () const
- bool **isOutputShutdown** () const
- virtual **decaf::io::InputStream** \* **getInputStream** () throw ( decaf::io::IOException )  
*Gets the **InputStream** for this socket if its connected.*
- virtual **decaf::io::OutputStream** \* **getOutputStream** () throw ( decaf::io::IOException )  
*Gets the **OutputStream** for this socket if it is connected.*
- int **getPort** () const  
*Gets the on the remote host this **Socket** (p. 3607) is connected to.*
- int **getLocalPort** () const  
*Gets the local port the socket is bound to.*

- std::string **getInetAddress** () const  
*Returns the address to which the socket is connected.*
- std::string **getLocalAddress** () const  
*Gets the local address to which the socket is bound.*
- virtual void **shutdownInput** () throw ( decaf::io::IOException )  
*Shuts down the InputStream for this socket essentially marking it as EOF.*
- virtual void **shutdownOutput** () throw ( decaf::io::IOException )  
*Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OutputStream::write will throw an IOException.*
- virtual int **getSoLinger** () const throw ( SocketException )  
*Gets the linger time for the socket, SO\_LINGER.*
- virtual void **setSoLinger** (bool state, int timeout) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )  
*Sets the linger time (SO\_LINGER) using a specified time value, this limits of this value are platform specific.*
- virtual bool **getKeepAlive** () const throw ( SocketException )  
*Gets the keep alive flag for this socket, SO\_KEEPAIVE.*
- virtual void **setKeepAlive** (bool keepAlive) throw ( SocketException )  
*Enables/disables the keep alive flag for this socket, SO\_KEEPAIVE.*
- virtual int **getReceiveBufferSize** () const throw ( SocketException )  
*Gets the receive buffer size for this socket, SO\_RCVBUF.*
- virtual void **setReceiveBufferSize** (int size) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )  
*Sets the receive buffer size for this socket, SO\_RCVBUF.*
- virtual bool **getReuseAddress** () const throw ( SocketException )  
*Gets the reuse address flag, SO\_REUSEADDR.*
- virtual void **setReuseAddress** (bool reuse) throw ( SocketException )  
*Sets the reuse address flag, SO\_REUSEADDR.*
- virtual int **getSendBufferSize** () const throw ( SocketException )  
*Gets the send buffer size for this socket, SO\_SNDBUF, this value is used by the platform socket to buffer data written to the socket.*
- virtual void **setSendBufferSize** (int size) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )

*Gets the send buffer size for this socket, `SO_SNDBUF`, this value is used by the platform socket to buffer data written to the socket.*

- virtual int **getSoTimeout** () const throw ( SocketException )  
*Gets the timeout for socket operations, `SO_TIMEOUT`.*
- virtual void **setSoTimeout** (int timeout) throw ( SocketException, decaf::lang::exceptions::IllegalArgument )  
*Sets the timeout for socket operations, `SO_TIMEOUT`.*
- virtual bool **getTcpNoDelay** () const throw ( SocketException )  
*Gets the Status of the `TCP_NODELAY` setting for this socket.*
- virtual void **setTcpNoDelay** (bool value) throw ( SocketException )  
*Sets the Status of the `TCP_NODELAY` param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 3607).*
- virtual int **getTrafficClass** () const throw ( SocketException )  
*Gets the Traffic Class setting for this **Socket** (p. 3607), sometimes referred to as Type of Service setting.*
- virtual void **setTrafficClass** (int value) throw ( SocketException, decaf::lang::exceptions::IllegalArgument )  
*Gets the Traffic Class setting for this **Socket** (p. 3607), sometimes referred to as Type of Service setting.*
- virtual bool **getOOBInline** () const throw ( SocketException )  
*Gets the value of the `OOBINLINE` for this socket.*
- virtual void **setOOBInline** (bool value) throw ( SocketException )  
*Sets the value of the `OOBINLINE` for this socket, by default this option is disabled.*
- virtual void **sendUrgentData** (int data) throw ( decaf::io::IOException )  
*Sends on byte of urgent data to the **Socket** (p. 3607).*
- virtual std::string **toString** () const

### Static Public Member Functions

- static void **setSocketImplFactory** (SocketImplFactory \*factory) throw ( decaf::io::IOException, decaf::net::SocketException )  
*Sets the instance of a **SocketImplFactory** (p. 3644) that the **Socket** (p. 3607) class should use when new instances of this class are created.*

### 6.746.1 Detailed Description

Since

1.0

### 6.746.2 Constructor & Destructor Documentation

#### 6.746.2.1 decaf::net::Socket::Socket ( )

Creates an unconnected **Socket** (p. 3607) using the set **SocketImplFactory** (p. 3644) or if non is set than the default **SocketImpl** type is created.

#### 6.746.2.2 decaf::net::Socket::Socket ( **SocketImpl** \* *impl* )

Creates a **Socket** (p. 3607) wrapping the provided **SocketImpl** (p. 3635) instance, this **Socket** (p. 3607) is considered unconnected.

The **Socket** (p. 3607) class takes ownership of this **SocketImpl** (p. 3635) pointer and will delete it when the **Socket** (p. 3607) class is destroyed.

## Parameters

<i>impl</i>	The <b>SocketImpl</b> (p. 3635) instance to wrap.
-------------	---

## Exceptions

<i>NullPointerException</i>	if the passed <b>SocketImpl</b> (p. 3635) is Null.
-----------------------------	--

**6.746.2.3 decaf::net::Socket::Socket ( const InetAddress \* *address*, int *port* )**

Creates a new **Socket** (p. 3607) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 3644) set then the SocketImpl is created using the factory otherwise the default **Socket** (p. 3607) implementation is used.

If the host parameter is empty then the loop back address is used.

**Parameters**

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]

**Exceptions**

<b>UnknownHostException</b> (p. 4019)	if the host cannot be resolved.
<b>IOException</b>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<b>NullPointerException</b>	if the <b>InetAddress</b> (p. 2077) instance is NULL.
<b>IllegalArgumentException</b>	if the port is not in range [0...65535]

**6.746.2.4 decaf::net::Socket::Socket ( const InetAddress \* *address*, int *port*, const InetAddress \* *localAddress*, int *localPort* )**

Creates a new **Socket** (p. 3607) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 3644) set then the SocketImpl is created using the factory otherwise the default **Socket** (p. 3607) implementation is used. The **Socket** (p. 3607) will also bind to the local address and port specified.

**Parameters**

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]
<i>localAddress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

**Exceptions**

<b>UnknownHostException</b> (p. 4019)	if the host cannot be resolved.
<b>IOException</b>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<b>NullPointerException</b>	if the <b>InetAddress</b> (p. 2077) instance is NULL.

<i>IllegalArgumentEx- ception</i>	if the port if not in range [0...65535]
---------------------------------------	---

#### 6.746.2.5 decaf::net::Socket::Socket ( const std::string & *host*, int *port* )

Creates a new **Socket** (p. 3607) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 3644) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 3607) implementation is used.

If the host parameter is empty then the loop back address is used.

##### Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loopback.
<i>port</i>	The port number to connect to [0...65535]

##### Exceptions

<i>UnknownHostException</i> (p. 4019)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<i>IllegalArgumentEx- ception</i>	if the port if not in range [0...65535]

#### 6.746.2.6 decaf::net::Socket::Socket ( const std::string & *host*, int *port*, const InetAddress \* *localAddress*, int *localPort* )

Creates a new **Socket** (p. 3607) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 3644) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 3607) implementation is used.

If the host parameter is empty then the loop back address is used.

##### Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loopback.
<i>port</i>	The port number to connect to [0...65535]
<i>localAd- dress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

##### Exceptions

<i>UnknownHostException</i> (p. 4019)	if the host cannot be resolved.
--	---------------------------------

<i>IOException</i>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<i>IllegalArgumentEx- ception</i>	if the port if not in range [0...65535]

**6.746.2.7** virtual **decaf::net::Socket::~~Socket** ( ) [virtual]

### 6.746.3 Member Function Documentation

**6.746.3.1** void **decaf::net::Socket::accepted** ( ) [protected]

**6.746.3.2** virtual void **decaf::net::Socket::bind** ( const std::string & *ipaddress*, int *port* ) throw ( **decaf::io::IOException**, **decaf::lang::exceptions::IllegalArgumentException** ) [virtual]

Binds this **Socket** (p. 3607) to the given local address and port.

If the **SocketAddress** (p. 3626) value is NULL then the **Socket** (p. 3607) will be bound to an available local address and port.

#### Parameters

<i>ipaddress</i>	The local address and port to bind the socket to.
<i>port</i>	The port on the local machine to bind to.

#### Exceptions

<i>IOException</i>	if an error occurs during the bind operation.
<i>IllegalArgumentEx- ception</i>	if the <b>Socket</b> (p. 3607) can't process the subclass of <b>SocketAddress</b> (p. 3626) that has been provided.

**6.746.3.3** void **decaf::net::Socket::checkClosed** ( ) const throw ( **decaf::io::IOException** ) [protected]

**6.746.3.4** virtual void **decaf::net::Socket::close** ( ) throw ( **decaf::io::IOException** ) [virtual]

Closes the **Socket** (p. 3607).

Once closed a **Socket** (p. 3607) cannot be connected or otherwise operated upon, a new **Socket** (p. 3607) instance must be created.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while closing the <b>Socket</b> (p. 3607).
--------------------	---

Implements **decaf::io::Closeable** (p. 1181).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2947).

**6.746.3.5** virtual void decaf::net::Socket::connect ( const std::string & *host*, int *port*, int *timeout* ) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException ) [virtual]

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 3650) is thrown. A timeout value of zero is treated as an infinite timeout.

#### Parameters

<i>host</i>	The host name or IP address of the remote host to connect to.
<i>port</i>	The port on the remote host to connect to.
<i>timeout</i>	The number of Milliseconds to wait before treating the connection as failed.

#### Exceptions

<i>IOException</i>	Thrown if a failure occurred in the connect.
<i>SocketTimeoutException</i> (p. 3650)	if the timeout for connection is exceeded.
<i>IllegalArgumentEx-ception</i>	if the timeout value is negative or the endpoint is invalid.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2947).

**6.746.3.6** virtual void decaf::net::Socket::connect ( const std::string & *host*, int *port* ) throw ( decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException ) [virtual]

Connects to the specified destination.

#### Parameters

<i>host</i>	The host name or IP address of the remote host to connect to.
<i>port</i>	The port on the remote host to connect to.

#### Exceptions

<i>IOException</i>	Thrown if a failure occurred in the connect.
<i>IllegalArgumentEx-ception</i>	if the timeout value is negative or the endpoint is invalid.

**6.746.3.7** `void decaf::net::Socket::ensureCreated ( ) const throw ( decaf::io::IOException )`  
`[protected]`

**6.746.3.8** `std::string decaf::net::Socket::getInetAddress ( ) const`

Returns the address to which the socket is connected.

#### Returns

the remote IP address to which this socket is connected, or null if the socket is not connected.

**6.746.3.9** `virtual decaf::io::InputStream* decaf::net::Socket::getInputStream ( ) throw ( decaf::io::IOException )` `[virtual]`

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 3607) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 3607).

#### Returns

The InputStream for this socket.

#### Exceptions

<i>IOException</i>	if an error occurs during creation of the InputStream, also if the <b>Socket</b> (p. 3607) is not connected or the input has been shutdown previously.
--------------------	--

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2948).

**6.746.3.10** `virtual bool decaf::net::Socket::getKeepAlive ( ) const throw ( SocketException )`  
`[virtual]`

Gets the keep alive flag for this socket, SO\_KEEPALIVE.

#### Returns

true if keep alive is enabled for this socket.

#### Exceptions

<i>SocketException</i> (p. 3627)	if the operation fails.
-------------------------------------	-------------------------

**6.746.3.11** `std::string decaf::net::Socket::getLocalAddress ( ) const`

Gets the local address to which the socket is bound.

**Returns**

the local address to which the socket is bound or `InetAddress.anyLocalAddress()` if the socket is not bound yet.

**6.746.3.12** `int decaf::net::Socket::getLocalPort ( ) const`

Gets the local port the socket is bound to.

**Returns**

the local port the socket was bound to, or -1 if the socket is not bound.

**6.746.3.13** `virtual bool decaf::net::Socket::getOOBInline ( ) const throw ( SocketException )`  
[virtual]

Gets the value of the OOBINLINE for this socket.

**Returns**

true if OOBINLINE is enabled, false otherwise.

**Exceptions**

<i>SocketException</i> (p. 3627)	if an error is encountered while performing this operation.
-------------------------------------	---

**6.746.3.14** `virtual decaf::io::OutputStream* decaf::net::Socket::getOutputStream ( )`  
`throw ( decaf::io::IOException )` [virtual]

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 3607) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 3607) will also close the underlying **Socket** (p. 3607).

**Returns**

the OutputStream for this socket.

**Exceptions**

<i>IOException</i>	if an error occurs during the creation of this OutputStream, or if the <b>Socket</b> (p. 3607) is closed or the output has been shutdown previously.
--------------------	--

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2949).

**6.746.3.15** `int decaf::net::Socket::getPort ( ) const`

Gets the on the remote host this **Socket** (p. 3607) is connected to.

#### Returns

the port on the remote host the socket is connected to, or 0 if not connected.

**6.746.3.16** `virtual int decaf::net::Socket::getReceiveBufferSize ( ) const throw ( SocketException ) [virtual]`

Gets the receive buffer size for this socket, SO\_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

#### Returns

the receive buffer size in bytes.

#### Exceptions

<i><b>SocketException</b></i> (p. 3627)	if the operation fails.
--	-------------------------

**6.746.3.17** `virtual bool decaf::net::Socket::getReuseAddress ( ) const throw ( SocketException ) [virtual]`

Gets the reuse address flag, SO\_REUSEADDR.

#### Returns

True if the address can be reused.

#### Exceptions

<i><b>SocketException</b></i> (p. 3627)	if the operation fails.
--	-------------------------

**6.746.3.18** `virtual int decaf::net::Socket::getSendBufferSize ( ) const throw ( SocketException ) [virtual]`

Gets the send buffer size for this socket, SO\_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

**Returns**

the size in bytes of the send buffer.

**Exceptions**

<i>SocketException</i> (p. 3627)	if the operation fails.
-------------------------------------	-------------------------

**6.746.3.19** `virtual int decaf::net::Socket::getSoLinger ( ) const throw ( SocketException )`  
[virtual]

Gets the linger time for the socket, SO\_LINGER.

A return value of -1 indicates that the option is disabled.

**Returns**

The linger time in seconds.

**Exceptions**

<i>SocketException</i> (p. 3627)	if the operation fails.
-------------------------------------	-------------------------

**6.746.3.20** `virtual int decaf::net::Socket::getSoTimeout ( ) const throw ( SocketException )`  
[virtual]

Gets the timeout for socket operations, SO\_TIMEOUT.

**Returns**

The timeout in milliseconds for socket operations.

**Exceptions**

<i>SocketException</i> (p. 3627)	Thrown if unable to retrieve the information.
-------------------------------------	---

**6.746.3.21** `virtual bool decaf::net::Socket::getTcpNoDelay ( ) const throw ( SocketException )`  
[virtual]

Gets the Status of the TCP\_NODELAY setting for this socket.

**Returns**

true if TCP\_NODELAY is enabled for the socket.

**Exceptions**

<b><i>SocketException</i></b> (p. 3627)	Thrown if unable to set the information.
--	--

**6.746.3.22** `virtual int decaf::net::Socket::getTrafficClass ( ) const throw ( SocketException )`  
[virtual]

Gets the Traffic Class setting for this **Socket** (p. 3607), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 3607) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

**Returns**

the bitset result of querying the traffic class setting.

**Exceptions**

<b><i>SocketException</i></b> (p. 3627)	if an error is encountered while performing this operation.
--	---

**6.746.3.23** `void decaf::net::Socket::initSocketImpl ( const std::string & address, int port, const InetAddress * localAddress, int localPort ) throw ( decaf::io::IOException, decaf::net::UnknownHostException )` [protected]

**6.746.3.24** `bool decaf::net::Socket::isBound ( ) const` [inline]

**Returns**

true if this **Socket** (p. 3607) has been bound to a Local address.

**6.746.3.25** `bool decaf::net::Socket::isClosed ( ) const` [inline]

**Returns**

true if the **Socket** (p. 3607) has been closed.

**6.746.3.26** `bool decaf::net::Socket::isConnected ( ) const` [inline]

Indicates whether or not this socket is connected to an end point.

**Returns**

true if connected, false otherwise.

**6.746.3.27** `bool decaf::net::Socket::isInputShutdown ( ) const [inline]`

#### Returns

true if input on this **Socket** (p. 3607) has been shutdown.

**6.746.3.28** `bool decaf::net::Socket::isOutputShutdown ( ) const [inline]`

#### Returns

true if output on this **Socket** (p. 3607) has been shutdown.

**6.746.3.29** `virtual void decaf::net::Socket::sendUrgentData ( int data ) throw ( decaf::io::IOException ) [virtual]`

Sends on byte of urgent data to the **Socket** (p. 3607).

#### Parameters

<i>data</i>	The value to write as urgent data, only the lower eight bits are sent.
-------------	--

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2951).

**6.746.3.30** `virtual void decaf::net::Socket::setKeepAlive ( bool keepAlive ) throw ( SocketException ) [virtual]`

Enables/disables the keep alive flag for this socket, SO\_KEEPALIVE.

#### Parameters

<i>keepAlive</i>	If true, enables the flag.
------------------	----------------------------

#### Exceptions

<i>SocketException</i> (p. 3627)	if the operation fails.
-------------------------------------	-------------------------

**6.746.3.31** `virtual void decaf::net::Socket::setOOBInline ( bool value ) throw ( SocketException ) [virtual]`

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

**Returns**

true if OOBINLINE is enabled, false otherwise.

**Exceptions**

<i><b>SocketException</b></i> (p. 3627)	if an error is encountered while performing this operation.
--	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2952).

**6.746.3.32** `virtual void decaf::net::Socket::setReceiveBufferSize ( int size ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )`  
[virtual]

Sets the receive buffer size for this socket, SO\_RCVBUF.

**Parameters**

<i>size</i>	Number of bytes to set the receive buffer to.
-------------	---

**Exceptions**

<i><b>SocketException</b></i> (p. 3627)	if the operation fails.
<i><b>IllegalArgumentException</b></i>	if the value is zero or negative.

**6.746.3.33** `virtual void decaf::net::Socket::setReuseAddress ( bool reuse ) throw ( SocketException )` [virtual]

Sets the reuse address flag, SO\_REUSEADDR.

**Parameters**

<i>reuse</i>	If true, sets the flag.
--------------	-------------------------

**Exceptions**

<i><b>SocketException</b></i> (p. 3627)	if the operation fails.
--	-------------------------

**6.746.3.34** `virtual void decaf::net::Socket::setSendBufferSize ( int size ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )`  
[virtual]

Gets the send buffer size for this socket, SO\_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

**Parameters**

<i>size</i>	The number of bytes to set the send buffer to, must be larger than zero.
-------------	--

**Exceptions**

<b><i>SocketException</i></b> (p. 3627)	if the operation fails.
<b><i>IllegalArgumentException</i></b>	if the value is zero or negative.

**6.746.3.35** `static void decaf::net::Socket::setSocketImplFactory ( SocketImplFactory *  
factory ) throw ( decaf::io::IOException, decaf::net::SocketException )  
[static]`

Sets the instance of a **SocketImplFactory** (p. 3644) that the **Socket** (p. 3607) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

**Parameters**

<i>factory</i>	The instance of a <b>SocketImplFactory</b> (p. 3644) to use when new <b>Socket</b> (p. 3607) objects are created.
----------------	---

**Exceptions**

<b><i>IOException</i></b>	if an I/O error occurs while performing this operation.
<b><i>SocketException</i></b> (p. 3627)	if this method has already been called with a valid factory.

**6.746.3.36** `virtual void decaf::net::Socket::setSoLinger ( bool state, int timeout ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )  
[virtual]`

Sets the linger time (SO\_LINGER) using a specified time value, this limits of this value are platform specific.

**Parameters**

<i>state</i>	The state of SO_LINGER, true is on.
<i>timeout</i>	The linger time in seconds, must be non-negative.

**Exceptions**

<b><i>SocketException</i></b> (p. 3627)	if the operation fails.
<b><i>IllegalArgumentException</i></b>	if state is true and timeout is negative.

**6.746.3.37** `virtual void decaf::net::Socket::setSoTimeout ( int timeout ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )`  
[virtual]

Sets the timeout for socket operations, SO\_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

#### Parameters

<i>timeout</i>	The timeout in milliseconds for socket operations.
----------------	--

#### Exceptions

<b>SocketException</b> (p. 3627)	Thrown if unable to set the information.
<b>IllegalArgumentException</b>	if the timeout value is negative.

**6.746.3.38** `virtual void decaf::net::Socket::setTcpNoDelay ( bool value ) throw ( SocketException )` [virtual]

Sets the Status of the TCP\_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 3607).

#### Parameters

<i>value</i>	The setting for the socket's TCP_NODELAY option, true to enable.
--------------	--

#### Exceptions

<b>SocketException</b> (p. 3627)	Thrown if unable to set the information.
-------------------------------------	--

**6.746.3.39** `virtual void decaf::net::Socket::setTrafficClass ( int value ) throw ( SocketException, decaf::lang::exceptions::IllegalArgumentException )`  
[virtual]

Gets the Traffic Class setting for this **Socket** (p. 3607), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 3607) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

#### Parameters

<i>value</i>	The integer value representing the traffic class setting bitset.
--------------	--

**Exceptions**

<i>SocketException</i> (p. 3627)	if an error is encountered while performing this operation.
<i>IllegalArgumentEx- ception</i>	if the value is not in the range [0..255].

**6.746.3.40** virtual void decaf::net::Socket::shutdownInput ( ) throw ( decaf::io::IOException ) [virtual]

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2953).

**6.746.3.41** virtual void decaf::net::Socket::shutdownOutput ( ) throw ( decaf::io::IOException ) [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OutputStream::write will throw an IOException.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2954).

**6.746.3.42** virtual std::string decaf::net::Socket::toString ( ) const [virtual]

**Returns**

a string representing this **Socket** (p. 3607).

**6.746.4 Friends And Related Function Documentation**

**6.746.4.1** friend class ServerSocket [friend]

**6.746.5 Field Documentation**

**6.746.5.1** SocketImpl\* decaf::net::Socket::impl [mutable, protected]

The documentation for this class was generated from the following file:

- `src/main/decaf/net/Socket.h`

## 6.747 decaf::net::SocketAddress Class Reference

Base class for protocol specific **Socket** (p. 3607) addresses.

```
#include <src/main/decaf/net/SocketAddress.h>
```

Inheritance diagram for `decaf::net::SocketAddress`:

### Public Member Functions

- `virtual ~SocketAddress ()`

#### 6.747.1 Detailed Description

Base class for protocol specific **Socket** (p. 3607) addresses. These classes provide an immutable address object that is used by the **Socket** (p. 3607) classes.

Since

1.0

#### 6.747.2 Constructor & Destructor Documentation

6.747.2.1 `virtual decaf::net::SocketAddress::~~SocketAddress ( ) [inline, virtual]`

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketAddress.h`

## 6.748 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

```
#include <src/main/decaf/net/SocketError.h>
```

### Static Public Member Functions

- `static int getErrorCode ()`  
*Gets the last error appropriate for the platform.*

- static std::string **getErrorString** ()  
*Gets the string description for the last error.*

### 6.748.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

### 6.748.2 Member Function Documentation

#### 6.748.2.1 static int decaf::net::SocketError::getErrorCode ( ) [static]

Gets the last error appropriate for the platform.

#### 6.748.2.2 static std::string decaf::net::SocketError::getErrorString ( ) [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketError.h**

## 6.749 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

```
#include <src/main/decaf/net/SocketException.h>
```

Inheritance diagram for decaf::net::SocketException:

### Public Member Functions

- **SocketException** () throw ()
- **SocketException** (const lang::Exception &ex) throw ()
- **SocketException** (const **SocketException** &ex) throw ()
- **SocketException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **SocketException** (const std::exception \*cause) throw ()  
*Constructor.*
- **SocketException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()

*Constructor - Initializes the file name and line number where this message occurred.*

- virtual **SocketException** \* **clone** () const  
*Clones this exception.*
- virtual ~**SocketException** () throw ()

### 6.749.1 Detailed Description

Exception for errors when manipulating sockets.

### 6.749.2 Constructor & Destructor Documentation

6.749.2.1 **decaf::net::SocketException::SocketException** ( ) throw () [inline]

6.749.2.2 **decaf::net::SocketException::SocketException** ( const lang::Exception & *ex* ) throw () [inline]

6.749.2.3 **decaf::net::SocketException::SocketException** ( const SocketException & *ex* ) throw () [inline]

6.749.2.4 **decaf::net::SocketException::SocketException** ( const char \* *file*, const int *lineNumber*, const std::exception \* *cause*, const char \* *msg*, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.749.2.5 **decaf::net::SocketException::SocketException** ( const std::exception \* *cause* ) throw () [inline]

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.749.2.6** `decaf::net::SocketException::SocketException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.749.2.7** `virtual decaf::net::SocketException::~~SocketException ( ) throw () [inline, virtual]`

### 6.749.3 Member Function Documentation

**6.749.3.1** `virtual SocketException* decaf::net::SocketException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 2212).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2958), **decaf::net::BindException** (p. 844), **decaf::net::ConnectException** (p. 1296), **decaf::net::NoRouteToHostException** (p. 2907), and **decaf::net::PortUnreachableException** (p. 3062).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketException.h`

## 6.750 decaf::net::SocketFactory Class Reference

The **SocketFactory** (p. 3629) is used to create **Socket** (p. 3607) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

```
#include <src/main/decaf/net/SocketFactory.h>
```

Inheritance diagram for decaf::net::SocketFactory:

## Public Member Functions

- virtual **~SocketFactory** ()
- virtual **Socket \* createSocket** () throw ( decaf::io::IOException )  
*Creates an unconnected **Socket** (p. 3607) object.*
- virtual **Socket \* createSocket** (const **InetAddress** \*host, int port)=0 throw ( decaf::io::IOException, decaf::net::UnknownHostException )  
*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*
- virtual **Socket \* createSocket** (const **InetAddress** \*host, int port, const **InetAddress** \*ifAddress, int localPort)=0 throw ( decaf::io::IOException, decaf::net::UnknownHostException )

- virtual **Socket \* createSocket** (const std::string &name, int port, const **InetAddress** \*ifAddress, int localPort)=0 throw ( decaf::io::IOException, decaf::net::UnknownHostException )  
*Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).*

## Static Public Member Functions

- static **SocketFactory \* getDefault** ()  
*Returns an pointer to the default **SocketFactory** (p. 3629) for this Application, there is only one default **SocketFactory** (p. 3629) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 3629) class and in not to be deleted by the caller.*

## Protected Member Functions

- **SocketFactory** ()

### 6.750.1 Detailed Description

The **SocketFactory** (p. 3629) is used to create **Socket** (p. 3607) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

#### See also

**decaf.net.Socket** (p. 3607)

#### Since

1.0

### 6.750.2 Constructor & Destructor Documentation

6.750.2.1 **decaf::net::SocketFactory::SocketFactory** ( ) [protected]

6.750.2.2 **virtual decaf::net::SocketFactory::~~SocketFactory** ( ) [virtual]

### 6.750.3 Member Function Documentation

6.750.3.1 **virtual Socket\*** **decaf::net::SocketFactory::createSocket** ( ) throw ( **decaf::io::IOException** ) [virtual]

Creates an unconnected **Socket** (p. 3607) object.

#### Returns

a new **Socket** (p. 3607) object, caller must free this object when done.

#### Exceptions

<i>IOException</i>	if the <b>Socket</b> (p. 3607) cannot be created.
--------------------	---

Reimplemented in **decaf::internal::net::DefaultSocketFactory** (p. 1741), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1753), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2962).

6.750.3.2 **virtual Socket\*** **decaf::net::SocketFactory::createSocket** ( **const InetAddress \*** *host*, **int** *port* ) throw ( **decaf::io::IOException**, **decaf::net::UnknownHostException** ) [pure virtual]

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

#### Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

**Returns**

a new **Socket** (p. 3607) object, caller must free this object when done.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1743), **decaf::internal::net::ssl::DefaultSSL** (p. 1754), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2963).

```
6.750.3.3  virtual Socket* decaf::net::SocketFactory::createSocket ( const std::string
& name, int port, const InetAddress * ifAddress, int localPort ) throw (
decaf::io::IOException, decaf::net::UnknownHostException ) [pure
virtual]
```

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

**Parameters**

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the <b>Socket</b> (p. 3607) to.
<i>localPort</i>	The local port to bind the <b>Socket</b> (p. 3607) to.

**Returns**

a new **Socket** (p. 3607) object, caller must free this object when done.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1741), **decaf::internal::net::ssl::DefaultSSL** (p. 1755), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2964).

```
6.750.3.4  virtual Socket* decaf::net::SocketFactory::createSocket ( const
std::string & name, int port ) throw ( decaf::io::IOException,
decaf::net::UnknownHostException ) [pure virtual]
```

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

**Parameters**

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

**Returns**

a new **Socket** (p. 3607) object, caller must free this object when done.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1742), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1755), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2964).

```
6.750.3.5 virtual Socket* decaf::net::SocketFactory::createSocket ( const InetAddress
* host, int port, const InetAddress * ifAddress, int localPort ) throw (
decaf::io::IOException, decaf::net::UnknownHostException ) [pure
virtual]
```

Creates a new **Socket** (p. 3607) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3629).

The **Socket** (p. 3607) will be bound to the specified local address and port.

**Parameters**

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the <b>Socket</b> (p. 3607) to.
<i>localPort</i>	The local port to bind the <b>Socket</b> (p. 3607) to.

**Returns**

a new **Socket** (p. 3607) object, caller must free this object when done.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while creating the <b>Socket</b> (p. 3607) object.
<b>UnknownHostException</b> (p. 4019)	if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1742), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1756), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2965).

**6.750.3.6 static SocketFactory\* decaf::net::SocketFactory::getDefault ( ) [static]**

Returns an pointer to the default **SocketFactory** (p. 3629) for this Application, there is only one default **SocketFactory** (p. 3629) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 3629) class and in not to be deleted by the caller.

**Returns**

pointer to the applications default **SocketFactory** (p. 3629).

**Exceptions**

<b>SocketException</b> (p. 3627)	if an error occurs while getting the default instance.
-------------------------------------	--

Reimplemented in **decaf::net::ssl::SSLSocketFactory** (p. 3681).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketFactory.h**

**6.751 decaf::internal::net::SocketFileDescriptor Class Reference**

File Descriptor type used internally by Decaf Socket objects.

```
#include <src/main/decaf/internal/net/SocketFileDescriptor.h>
```

Inheritance diagram for decaf::internal::net::SocketFileDescriptor:

**Public Member Functions**

- **SocketFileDescriptor** (long value)
- virtual **~SocketFileDescriptor** ()
- long **getValue** () const

*Gets the OS Level FileDescriptor.*

**6.751.1 Detailed Description**

File Descriptor type used internally by Decaf Socket objects.

**Since**

1.0

## 6.751.2 Constructor & Destructor Documentation

6.751.2.1 decaf::internal::net::SocketFileDescriptor::SocketFileDescriptor ( long *value* )

6.751.2.2 virtual decaf::internal::net::SocketFileDescriptor::~~SocketFileDescriptor ( )  
[virtual]

## 6.751.3 Member Function Documentation

6.751.3.1 long decaf::internal::net::SocketFileDescriptor::getValue ( ) const

Gets the OS Level FileDescriptor.

### Returns

a FileDescriptor value.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/SocketFileDescriptor.h

## 6.752 decaf::net::SocketImpl Class Reference

Acts as a base class for all physical **Socket** (p. 3607) implementations.

```
#include <src/main/decaf/net/SocketImpl.h>
```

Inheritance diagram for decaf::net::SocketImpl:

### Public Member Functions

- **SocketImpl** ()
- virtual ~**SocketImpl** ()
- virtual void **create** ()=0 throw ( decaf::io::IOException )  
*Creates the underlying platform **Socket** (p.3607) data structures which allows for **Socket** (p. 3607) options to be applied.*
- virtual void **accept** (**SocketImpl** \*socket)=0 throw ( decaf::io::IOException, decaf::net::SocketException, decaf::net::SocketTimeoutException )  
*Accepts a new connection on the given **Socket** (p. 3607).*
- virtual void **connect** (const std::string &hostname, int **port**, int timeout)=0 throw ( decaf::io::IOException, decaf::net::SocketTimeoutException, decaf::lang::exceptions::IllegalArgumentException )  
*Connects this socket to the given host and port.*

*Gets the port that this socket has been assigned.*
- int **getLocalPort** () const  
*Gets the value of this **SocketImpl**'s local port field.*
- std::string **getInetAddress** () const  
*Gets the value of this **SocketImpl**'s address field.*
- const **decaf::io::FileDescriptor** \* **getFileDescriptor** () const

*Gets the FileDescriptor for this **Socket** (p. 3607), the Object is owned by this **Socket** (p. 3607) and should not be deleted by the caller.*

- virtual std::string **getLocalAddress** () const =0

*Gets the value of the local Inet address the **Socket** (p. 3607) is bound to if bound, otherwise return the **InetAddress** (p. 2077) ANY value "0.0.0.0".*

- std::string **toString** () const

*Returns a string containing the address and port of this **Socket** (p. 3607) instance.*

- virtual bool **supportsUrgentData** () const
- virtual void **sendUrgentData** (int data) throw ( decaf::io::IOException )

*Sends on byte of urgent data to the **Socket** (p. 3607).*

## Protected Attributes

- int **port**

*The remote port that this **Socket** (p. 3607) is connected to.*

- int **localPort**

*The port on the Local Machine that this **Socket** (p. 3607) is Bound to.*

- std::string **address**

*The Remote Address that the **Socket** (p. 3607) is connected to.*

- io::FileDescriptor \* **fd**

*The File Descriptor for this **Socket** (p. 3607).*

### 6.752.1 Detailed Description

Acts as a base class for all physical **Socket** (p. 3607) implementations.

Since

1.0

## 6.752.2 Constructor & Destructor Documentation

6.752.2.1 `decaf::net::SocketImpl::SocketImpl ( )`

6.752.2.2 `virtual decaf::net::SocketImpl::~~SocketImpl ( )` [virtual]

## 6.752.3 Member Function Documentation

6.752.3.1 `virtual void decaf::net::SocketImpl::accept ( SocketImpl * socket )  
throw ( decaf::io::IOException, decaf::net::SocketException,  
decaf::net::SocketTimeoutException )` [pure virtual]

Accepts a new connection on the given **Socket** (p. 3607).

### Parameters

<i>socket</i>	The accepted connection.
---------------	--------------------------

### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
<i>SocketException</i> (p. 3627)	if an error occurs while performing an Accept on the socket.
<i>SocketTimeoutException</i> (p. 3650)	if the accept call times out due to SO_TIMEOUT being set.

6.752.3.2 `virtual int decaf::net::SocketImpl::available ( ) throw ( decaf::io::IOException )`  
[pure virtual]

Gets the number of bytes that can be read from the **Socket** (p. 3607) without blocking.

### Returns

the number of bytes that can be read from the **Socket** (p. 3607) without blocking.

### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3854).

6.752.3.3 `virtual void decaf::net::SocketImpl::bind ( const std::string & ipaddress, int port )  
throw ( decaf::io::IOException )` [pure virtual]

Binds this **Socket** (p. 3607) instance to the local ip address and port number given.

**Parameters**

<i>ipaddress</i>	The address of local ip to bind to.
<i>port</i>	The port number on the host to bind to.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3854).

**6.752.3.4** `virtual void decaf::net::SocketImpl::close ( ) throw ( decaf::io::IOException )`  
[pure virtual]

Closes the socket, terminating any blocked reads or writes.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3855).

**6.752.3.5** `virtual void decaf::net::SocketImpl::connect ( const  
std::string & hostname, int port, int timeout ) throw (`  
**decaf::io::IOException, decaf::net::SocketTimeoutException,**  
**decaf::lang::exceptions::IllegalArgumentException )** [pure  
virtual]

Connects this socket to the given host and port.

**Parameters**

<i>hostname</i>	The name of the host to connect to, or IP address.
<i>port</i>	The port number on the host to connect to.
<i>timeout</i>	Time in milliseconds to wait for a connection, 0 indicates forever.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
<b>SocketTimeoutException</b> (p. 3650)	if the connect call times out due to timeout being set.
<i>IllegalArgumentEx- ception</i>	if a parameter has an illegal value.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3855).

**6.752.3.6** `virtual void decaf::net::SocketImpl::create ( ) throw ( decaf::io::IOException )`  
`[pure virtual]`

Creates the underlying platform **Socket** (p. 3607) data structures which allows for **Socket** (p. 3607) options to be applied.

The created socket is in an unconnected state.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3855).

**6.752.3.7** `const decaf::io::FileDescriptor* decaf::net::SocketImpl::getFileDescriptor ( )`  
`const [inline]`

Gets the FileDescriptor for this **Socket** (p. 3607), the Object is owned by this **Socket** (p. 3607) and should not be deleted by the caller.

#### Returns

a pointer to this Socket's FileDescriptor object.

**6.752.3.8** `std::string decaf::net::SocketImpl::getInetAddress ( ) const [inline]`

Gets the value of this SocketImpl's address field.

#### Returns

the value of the address field.

**6.752.3.9** `virtual decaf::io::InputStream* decaf::net::SocketImpl::getInputStream ( ) throw ( decaf::io::IOException )`  
`[pure virtual]`

Gets the InputStream linked to this **Socket** (p. 3607).

#### Returns

an InputStream pointer owned by the **Socket** (p. 3607) object.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3856).

**6.752.3.10** `virtual std::string decaf::net::SocketImpl::getLocalAddress ( ) const` [pure virtual]

Gets the value of the local Inet address the **Socket** (p. 3607) is bound to if bound, otherwise return the **InetAddress** (p. 2077) ANY value "0.0.0.0".

#### Returns

the local address bound to, or ANY.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3856).

**6.752.3.11** `int decaf::net::SocketImpl::getLocalPort ( ) const` [inline]

Gets the value of this SocketImpl's local port field.

#### Returns

the value of localPort.

**6.752.3.12** `virtual int decaf::net::SocketImpl::getOption ( int option ) const throw ( decaf::io::IOException )` [pure virtual]

Gets the specified **Socket** (p. 3607) option.

#### Parameters

<i>option</i>	The <b>Socket</b> (p. 3607) options whose value is to be retrieved.
---------------	---

#### Returns

the value of the given socket option.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3856).

**6.752.3.13** `virtual decaf::io::OutputStream* decaf::net::SocketImpl::getOutputStream ( ) throw ( decaf::io::IOException )` [pure virtual]

Gets the OutputStream linked to this **Socket** (p. 3607).

#### Returns

an OutputStream pointer owned by the **Socket** (p. 3607) object.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3857).

**6.752.3.14** `int decaf::net::SocketImpl::getPort ( ) const` `[inline]`

Gets the port that this socket has been assigned.

**Returns**

the Socket's port number.

**6.752.3.15** `virtual void decaf::net::SocketImpl::listen ( int backlog ) throw ( decaf::io::IOException )` `[pure virtual]`

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

**Parameters**

<i>backlog</i>	The maximum length of the connection queue.
----------------	---

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3857).

**6.752.3.16** `virtual void decaf::net::SocketImpl::sendUrgentData ( int data ) throw ( decaf::io::IOException )` `[virtual]`

Sends on byte of urgent data to the **Socket** (p. 3607).

**Parameters**

<i>data</i>	The value to write as urgent data, only the lower eight bits are sent.
-------------	--

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

**6.752.3.17** virtual void decaf::net::SocketImpl::setOption ( int *option*, int *value* ) throw ( decaf::io::IOException ) [pure virtual]

Sets the specified option on the **Socket** (p. 3607) if supported.

#### Parameters

<i>option</i>	The <b>Socket</b> (p. 3607) option to set.
<i>value</i>	The value of the socket option to apply to the socket.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3858).

**6.752.3.18** virtual void decaf::net::SocketImpl::shutdownInput ( ) throw ( decaf::io::IOException ) [pure virtual]

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 3643) on the socket, the stream will return EOF.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3859).

**6.752.3.19** virtual void decaf::net::SocketImpl::shutdownOutput ( ) throw ( decaf::io::IOException ) [pure virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 3643) on the socket, the stream will throw an IOException.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3859).

**6.752.3.20** `virtual bool decaf::net::SocketImpl::supportsUrgentData ( ) const` `[inline, virtual]`

#### Returns

true if this **SocketImpl** (p. 3635) supports sending Urgent Data. The default implementation always returns false.

**6.752.3.21** `std::string decaf::net::SocketImpl::toString ( ) const`

Returns a string containing the address and port of this **Socket** (p. 3607) instance.

#### Returns

a string containing the address and port of this socket.

### 6.752.4 Field Documentation

**6.752.4.1** `std::string decaf::net::SocketImpl::address` `[protected]`

The Remote Address that the **Socket** (p. 3607) is connected to.

**6.752.4.2** `io::FileDescriptor* decaf::net::SocketImpl::fd` `[protected]`

The File Descriptor for this **Socket** (p. 3607).

**6.752.4.3** `int decaf::net::SocketImpl::localPort` `[protected]`

The port on the Local Machine that this **Socket** (p. 3607) is Bound to.

**6.752.4.4** `int decaf::net::SocketImpl::port` `[protected]`

The remote port that this **Socket** (p. 3607) is connected to.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketImpl.h`

### 6.753 decaf::net::SocketImplFactory Class Reference

Factory class interface for a Factory that creates SocketImpl objects.

```
#include <src/main/decaf/net/SocketImplFactory.h>
```

## Public Member Functions

- virtual `~SocketImplFactory()`
- virtual `SocketImpl * createSocketImpl()=0`

*Creates a new SocketImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 3635).*

### 6.753.1 Detailed Description

Factory class interface for a Factory that creates SocketImpl objects. These factories can be used to create various types of Sockets, e.g. Streaming, Multicast, SSL, or platform specific variations of these types.

#### See also

**decaf::net::Socket** (p. 3607)  
**decaf::net::ServerSocket** (p. 3447)

#### Since

1.0

### 6.753.2 Constructor & Destructor Documentation

**6.753.2.1** virtual `decaf::net::SocketImplFactory::~~SocketImplFactory()` [`inline`, `virtual`]

### 6.753.3 Member Function Documentation

**6.753.3.1** virtual `SocketImpl* decaf::net::SocketImplFactory::createSocketImpl()` [`pure` `virtual`]

Creates a new SocketImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 3635).

#### Returns

new **SocketImpl** (p. 3635) instance that is owned by the caller.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketImplFactory.h`

## 6.754 decaf::net::SocketOptions Class Reference

- static const int **SOCKET\_OPTION\_KEEPALIVE**

*When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.*

- static const int **SOCKET\_OPTION\_OOINLINE**

*When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.*

### 6.754.1 Detailed Description

Since

1.0

### 6.754.2 Constructor & Destructor Documentation

6.754.2.1 virtual decaf::net::SocketOptions::~~SocketOptions ( ) [virtual]

### 6.754.3 Field Documentation

6.754.3.1 const int decaf::net::SocketOptions::SOCKET\_OPTION\_BINDADDR  
[static]

Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).

The default local address of a socket is INADDR\_ANY, meaning any local address on a multi-homed host. A multi-homed host can use this option to accept connections to only one of its addresses (in the case of a **ServerSocket** (p. 3447) or DatagramSocket), or to specify its return address to the peer (for a **Socket** (p. 3607) or DatagramSocket). The parameter of this option is an **InetAddress** (p. 2077).

6.754.3.2 const int decaf::net::SocketOptions::SOCKET\_OPTION\_BROADCAST  
[static]

Sets SO\_BROADCAST for a socket.

This option enables and disables the ability of the process to send broadcast messages. It is supported for only datagram sockets and only on networks that support the concept of a broadcast message (e.g. Ethernet, token ring, etc.), and it is set by default for DatagramSockets.

**6.754.3.3** `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_-MULTICAST_IF` [static]

Set which outgoing interface on which to send multicast packets.

Useful on hosts with multiple network interfaces, where applications want to use other than the system default. Takes/returns an **InetAddress** (p. 2077).

Valid for Multicast: DatagramSocketImpl.

**6.754.3.4** `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_-MULTICAST_IF2` [static]

Same as above.

This option is introduced so that the behaviour with IP\_MULTICAST\_IF will be kept the same as before, while this new option can support setting outgoing interfaces with either IPv4 and IPv6 addresses.

**6.754.3.5** `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_-MULTICAST_LOOP` [static]

This option enables or disables local loopback of multicast datagrams.

This option is enabled by default for Multicast Sockets.

**6.754.3.6** `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_TOS` [static]

This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.

**6.754.3.7** `const int decaf::net::SocketOptions::SOCKET_OPTION_KEEPALIVE` [static]

When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.

This probe is a TCP segment to which the peer must respond. One of three responses is expected: 1. The peer responds with the expected ACK. The application is not notified (since everything is OK). TCP will send another probe following another 2 hours of inactivity. 2. The peer responds with an RST, which tells the local TCP that the peer host has crashed and rebooted. The socket is closed. 3. There is no response from the peer. The socket is closed. The purpose of this option is to detect if the peer host crashes.

Valid only for TCP socket: **SocketImpl** (p. 3635)

**6.754.3.8 const int decaf::net::SocketOptions::SOCKET\_OPTION\_LINGER**  
[static]

Specify a linger-on-close timeout.

This option disables/enables immediate return from a close() of a TCP **Socket** (p. 3607). Enabling this option with a non-zero Integer timeout means that a close() will block pending the transmission and acknowledgment of all data written to the peer, at which point the socket is closed gracefully. Upon reaching the linger timeout, the socket is closed forcefully, with a TCP RST. Enabling the option with a timeout of zero does a forceful close immediately. If the specified timeout value exceeds 65,535 it will be reduced to 65,535.

Valid only for TCP: **SocketImpl** (p. 3635)

**6.754.3.9 const int decaf::net::SocketOptions::SOCKET\_OPTION\_OOINLINE**  
[static]

When the OOINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

When the option is disabled (which is the default) urgent data is silently discarded.

**6.754.3.10 const int decaf::net::SocketOptions::SOCKET\_OPTION\_RCVBUF**  
[static]

Set a hint the size of the underlying buffers used by the platform for incoming network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be received over the socket. When used in get, this must return the size of the buffer actually used by the platform when receiving in data on this socket. Valid for all sockets: **SocketImpl** (p. 3635), **DatagramSocketImpl**.

**6.754.3.11 const int decaf::net::SocketOptions::SOCKET\_OPTION\_-REUSEADDR** [static]

Sets SO\_REUSEADDR for a socket.

This is used only for MulticastSockets in decaf, and it is set by default for MulticastSockets.

**6.754.3.12 const int decaf::net::SocketOptions::SOCKET\_OPTION\_SNDBUF**  
[static]

Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be sent over the socket. When used in get, this must

return the size of the buffer actually used by the platform when sending out data on this socket. Valid for all sockets: **SocketImpl** (p. 3635), DatagramSocketImpl

#### 6.754.3.13 `const int decaf::net::SocketOptions::SOCKET_OPTION_TCP_NODELAY` [static]

Disable Nagle's algorithm for this connection.

Written data to the network is not buffered pending acknowledgment of previously written data. Valid for TCP sockets.

#### 6.754.3.14 `const int decaf::net::SocketOptions::SOCKET_OPTION_TIMEOUT` [static]

Set a timeout on blocking **Socket** (p. 3607) operations.

The option must be set prior to entering a blocking operation to take effect.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketOptions.h`

## 6.755 `decaf::net::SocketTimeoutException` Class Reference

```
#include <src/main/decaf/net/SocketTimeoutException.h>
```

Inheritance diagram for `decaf::net::SocketTimeoutException`:

### Public Member Functions

- **SocketTimeoutException** () throw ()  
*Default Constructor.*
- **SocketTimeoutException** (const Exception &ex) throw ()  
*Conversion Constructor from some other Exception.*
- **SocketTimeoutException** (const **SocketTimeoutException** &ex) throw ()  
*Copy Constructor.*
- **SocketTimeoutException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **SocketTimeoutException** (const std::exception \*cause) throw ()  
*Constructor.*

- **SocketTimeoutException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- virtual **SocketTimeoutException** \* clone () const  
*Clones this exception.*
- virtual ~**SocketTimeoutException** () throw ()

### 6.755.1 Constructor & Destructor Documentation

**6.755.1.1** decaf::net::SocketTimeoutException::SocketTimeoutException ( ) throw ()  
[inline]

Default Constructor.

**6.755.1.2** decaf::net::SocketTimeoutException::SocketTimeoutException ( const Exception & ex ) throw () [inline]

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.755.1.3** decaf::net::SocketTimeoutException::SocketTimeoutException ( const SocketTimeoutException & ex ) throw () [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.755.1.4** decaf::net::SocketTimeoutException::SocketTimeoutException ( const char \* file, const int lineNumber, const std::exception \* cause, const char \* msg, ... ) throw ()  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
-------------	--------------------------------------

<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.755.1.5** `decaf::net::SocketTimeoutException::SocketTimeoutException ( const std::exception * cause ) throw () [inline]`

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.755.1.6** `decaf::net::SocketTimeoutException::SocketTimeoutException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.755.1.7** `virtual decaf::net::SocketTimeoutException::~~SocketTimeoutException ( ) throw () [inline, virtual]`

## 6.755.2 Member Function Documentation

**6.755.2.1** `virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p. 2198).

The documentation for this class was generated from the following file:

- src/main/decaf/net/SocketTimeoutException.h

## 6.756 decaf::net::ssl::SSLContext Class Reference

Represents on implementation of the Secure **Socket** (p. 3607) Layer for streaming based sockets.

```
#include <src/main/decaf/net/ssl/SSLContext.h>
```

### Public Member Functions

- **SSLContext** (**SSLContextSpi** \*contextImpl)
- virtual **~SSLContext** ()
- **SocketFactory** \* **getSocketFactory** ()  
*Returns an **SocketFactory** (p. 3629) instance for use with this Context, the **SocketFactory** (p. 3629) is owned by the Context and should not be deleted by the caller.*
- **ServerSocketFactory** \* **getServerSocketFactory** ()  
*Returns an **ServerSocketFactory** (p. 3457) instance for use with this Context, the **ServerSocketFactory** (p. 3457) is owned by the Context and should not be deleted by the caller.*
- **SSLParameters** \* **getDefaultSSLParameters** ()
- **SSLParameters** \* **getSupportedSSLParameters** ()

### Static Public Member Functions

- static **SSLContext** \* **getDefault** ()  
*Gets the Default **SSLContext** (p. 3653).*
- static void **setDefault** (**SSLContext** \*context)  
*Sets the default **SSLContext** (p. 3653) to be returned from future calls to **getDefault**.*

### 6.756.1 Detailed Description

Represents on implementation of the Secure **Socket** (p. 3607) Layer for streaming based sockets. This class servers a a source of factories to be used to create new **SSL Socket** (p. 3607) instances.

Since

1.0

## 6.756.2 Constructor & Destructor Documentation

6.756.2.1 `decaf::net::ssl::SSLContext::SSLContext ( SSLContextSpi * contextImpl )`

6.756.2.2 `virtual decaf::net::ssl::SSLContext::~~SSLContext ( )` [*virtual*]

## 6.756.3 Member Function Documentation

6.756.3.1 `static SSLContext* decaf::net::ssl::SSLContext::getDefault ( )` [*static*]

Gets the Default **SSLContext** (p. 3653).

The default instance of the **SSLContext** (p. 3653) should be immediately usable without any need for the client to initialize this context.

### Returns

a pointer to the Default **SSLContext** (p. 3653) instance.

6.756.3.2 `SSLParameters* decaf::net::ssl::SSLContext::getDefaultSSLParameters ( )`

### Returns

a new instance of an **SSLParameters** (p. 3658) object containing the default set of settings for this **SSLContext** (p. 3653).

### Exceptions

<i>UnsupportedOperationException</i>	if the parameters cannot be retrieved.
--------------------------------------	--

6.756.3.3 `ServerSocketFactory* decaf::net::ssl::SSLContext::getServerSocketFactory ( )`

Returns an **ServerSocketFactory** (p. 3457) instance for use with this Context, the **ServerSocketFactory** (p. 3457) is owned by the Context and should not be deleted by the caller.

### Returns

a pointer to this **SSLContext**'s **ServerSocketFactory** (p. 3457) for creating **SSLServerSocket** (p. 3662) objects.

### Exceptions

<i>IllegalStateException</i>	if the <b>SSLContextSpi</b> (p. 3655) requires initialization but it has not yet been initialized.
------------------------------	--

**6.756.3.4 SocketFactory\* decaf::net::ssl::SSLContext::getSocketFactory ( )**

Returns an **SocketFactory** (p. 3629) instance for use with this Context, the **SocketFactory** (p. 3629) is owned by the Context and should not be deleted by the caller.

**Returns**

a pointer to this SSLContext's **SocketFactory** (p. 3629) for creating **SSLSocket** (p. 3670) objects.

**Exceptions**

<i>IllegalStateException</i>	if the <b>SSLContextSpi</b> (p. 3655) requires initialization but it has not yet been initialized.
------------------------------	--

**6.756.3.5 SSLParameters\* decaf::net::ssl::SSLContext::getSupportedSSLParameters ( )****Returns**

a new instance of an **SSLParameters** (p. 3658) object containing the complete set of settings for this **SSLContext** (p. 3653).

**Exceptions**

<i>UnsupportedOperationException</i>	if the parameters cannot be retrieved.
--------------------------------------	--

**6.756.3.6 static void decaf::net::ssl::SSLContext::setDefault ( SSLContext \* context )  
[static]**

Sets the default **SSLContext** (p. 3653) to be returned from future calls to getDefault.

The set **SSLContext** (p. 3653) must be fully initialized and usable. The caller is responsible for deleting this object before the Library shutdown methods are called.

**Exceptions**

<i>NullPointerException</i>	if the context passed is NULL.
-----------------------------	--------------------------------

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/SSLContext.h

**6.757 decaf::net::ssl::SSLContextSpi Class Reference**

Defines the interface that should be provided by an **SSLContext** (p. 3653) provider.

```
#include <src/main/decaf/net/ssl/SSLContextSpi.h>
```

Inheritance diagram for decaf::net::ssl::SSLContextSpi:

## Public Member Functions

- virtual `~SSLContextSpi()`
- virtual void `providerInit(security::SecureRandom *random)=0`  
*Perform the initialization of this Context.*
- virtual `SSLParameters * providerGetDefaultSSLParameters()`  
*Creates a returns a new **SSLParameters** (p. 3658) instance that contains the default settings for this Providers **SSLContext** (p. 3653).*
- virtual `SSLParameters * providerGetSupportedSSLParameters()`  
*Creates and returns a new **SSLParameters** (p. 3658) instance that contains the full set of supported parameters for this **SSL Context**.*
- virtual `SocketFactory * providerGetSocketFactory()=0`  
*Returns a **SocketFactory** (p. 3629) instance that can be used to create new **SSLSocket** (p. 3670) objects.*
- virtual `ServerSocketFactory * providerGetServerSocketFactory()=0`  
*Returns a **ServerSocketFactory** (p. 3457) instance that can be used to create new **SSLServerSocket** (p. 3662) objects.*

### 6.757.1 Detailed Description

Defines the interface that should be provided by an **SSLContext** (p. 3653) provider.

Since

1.0

### 6.757.2 Constructor & Destructor Documentation

6.757.2.1 virtual decaf::net::ssl::SSLContextSpi::~SSLContextSpi( ) [virtual]

### 6.757.3 Member Function Documentation

6.757.3.1 virtual SSLParameters\* decaf::net::ssl::SSLContextSpi::providerGetDefaultSSLParameters( ) [virtual]

Creates a returns a new **SSLParameters** (p. 3658) instance that contains the default settings for this Providers **SSLContext** (p. 3653).

The returned **SSLParameters** (p. 3658) instance is required to have non-empty values in its ciphersuites and protocols.

### Returns

new **SSLParameters** (p. 3658) instance with the **SSLContext** (p. 3653) defaults.

### Exceptions

<i>UnsupportedOperationException</i>	if the defaults cannot be obtained.
--------------------------------------	-------------------------------------

**6.757.3.2** virtual **ServerSocketFactory\*** **decaf::net::ssl::SSLContextSpi::providerGetServerSocketFactory** (  
     ) [pure virtual]

Returns a **ServerSocketFactory** (p. 3457) instance that can be used to create new **SSLServerSocket** (p. 3662) objects.

The **ServerSocketFactory** (p. 3457) is owned by the Service Provider and should not be destroyed by the caller.

### Returns

**SocketFactory** (p. 3629) instance that can be used to create new **SSLServerSockets**.

### Exceptions

<i>IllegalStateException</i>	if the <b>SSLContextSpi</b> (p. 3655) object requires initialization but has not been initialized yet.
------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2926).

**6.757.3.3** virtual **SocketFactory\*** **decaf::net::ssl::SSLContextSpi::providerGetSocketFactory** (  
     ) [pure virtual]

Returns a **SocketFactory** (p. 3629) instance that can be used to create new **SSLSocket** (p. 3670) objects.

The **SocketFactory** (p. 3629) is owned by the Service Provider and should not be destroyed by the caller.

### Returns

**SocketFactory** (p. 3629) instance that can be used to create new **SSLSockets**.

### Exceptions

<i>IllegalStateException</i>	if the <b>SSLContextSpi</b> (p. 3655) object requires initialization but has not been initialized yet.
------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2926).

**6.757.3.4** `virtual SSLParameters* decaf::net::ssl::SSLContextSpi::providerGetSupportedSSLParameters ( )` [virtual]

Creates and returns a new **SSLParameters** (p. 3658) instance that contains the full set of supported parameters for this SSL Context.

The returned **SSLParameters** (p. 3658) instance is required to have non-empty values in its ciphersuites and protocols.

#### Returns

a new **SSLParameters** (p. 3658) instance with the full set of settings that are supported.

#### Exceptions

<i>UnsupportedOperationException</i>	if the supported parameters cannot be obtained.
--------------------------------------	---

**6.757.3.5** `virtual void decaf::net::ssl::SSLContextSpi::providerInit ( security::SecureRandom * random )` [pure virtual]

Perform the initialization of this Context.

#### Parameters

<i>random</i>	Pointer to an instance of a secure random number generator.
---------------	---

#### Exceptions

<i>NullPointerException</i>	if the SecureRandom instance is NULL.
<i>KeyManagementException</i>	if an error occurs while initializing the context.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2927).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLContextSpi.h`

## 6.758 decaf::net::ssl::SSLParameters Class Reference

```
#include <src/main/decaf/net/ssl/SSLParameters.h>
```

## Public Member Functions

- **SSLParameters** ()

*Creates a new **SSLParameters** (p. 3658) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.*

- **SSLParameters** (const std::vector< std::string > &cipherSuites)

*Creates a new **SSLParameters** (p. 3658) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.*

- **SSLParameters** (const std::vector< std::string > &cipherSuites, const std::vector< std::string > &protocols)

*Creates a new **SSLParameters** (p. 3658) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.*

- virtual ~**SSLParameters** ()

- std::vector< std::string > **getCipherSuites** () const

- void **setCipherSuites** (const std::vector< std::string > &cipherSuites)

*Sets the vector of ciphersuites.*

- std::vector< std::string > **getProtocols** () const

- void **setProtocols** (const std::vector< std::string > &protocols)

*Sets the vector of protocols.*

- bool **getWantClientAuth** () const

- void **setWantClientAuth** (bool wantClientAuth)

*Sets whether client authentication should be requested.*

- bool **getNeedClientAuth** () const

- void **setNeedClientAuth** (bool needClientAuth)

*Sets whether client authentication should be required.*

## 6.758.1 Constructor & Destructor Documentation

### 6.758.1.1 decaf::net::ssl::SSLParameters::SSLParameters ( )

Creates a new **SSLParameters** (p. 3658) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.

### 6.758.1.2 decaf::net::ssl::SSLParameters::SSLParameters ( const std::vector< std::string > & cipherSuites )

Creates a new **SSLParameters** (p. 3658) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.

**Parameters**

<i>cipherSuites</i>	The vector of cipherSuites for this <b>SSLParameters</b> (p. 3658) instance (can be empty).
---------------------	---

**6.758.1.3** `decaf::net::ssl::SSLParameters::SSLParameters ( const std::vector< std::string > & cipherSuites, const std::vector< std::string > & protocols )`

Creates a new **SSLParameters** (p. 3658) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.

**Parameters**

<i>cipherSuites</i>	The vector of cipherSuites for this <b>SSLParameters</b> (p. 3658) instance (can be empty).
<i>protocols</i>	The vector of protocols for this <b>SSLParameters</b> (p. 3658) instance (can be empty).

**6.758.1.4** `virtual decaf::net::ssl::SSLParameters::~~SSLParameters ( )` [virtual]

**6.758.2 Member Function Documentation**

**6.758.2.1** `std::vector<std::string> decaf::net::ssl::SSLParameters::getCipherSuites ( ) const` [inline]

**Returns**

a copy of the vector of ciphersuites or an empty vector if none have been set.

**6.758.2.2** `bool decaf::net::ssl::SSLParameters::getNeedClientAuth ( ) const` [inline]

**Returns**

whether client authentication should be required.

**6.758.2.3** `std::vector<std::string> decaf::net::ssl::SSLParameters::getProtocols ( ) const` [inline]

**Returns**

a copy of the vector of protocols or an empty vector if none have been set.

**6.758.2.4** `bool decaf::net::ssl::SSLParameters::getWantClientAuth ( ) const` [inline]

**Returns**

whether client authentication should be requested.

**6.758.2.5** void decaf::net::ssl::SSLParameters::setCipherSuites ( const std::vector< std::string > & *cipherSuites* ) [inline]

Sets the vector of ciphersuites.

#### Parameters

<i>cipherSuites</i>	The vector of cipherSuites (can be an empty vector).
---------------------	--

**6.758.2.6** void decaf::net::ssl::SSLParameters::setNeedClientAuth ( bool *needClientAuth* ) [inline]

Sets whether client authentication should be required.

Calling this method clears the wantClientAuth flag.

#### Parameters

<i>needClientAuth</i>	whether client authentication should be required.
-----------------------	---

**6.758.2.7** void decaf::net::ssl::SSLParameters::setProtocols ( const std::vector< std::string > & *protocols* ) [inline]

Sets the vector of protocols.

#### Parameters

<i>protocols</i>	the vector of protocols (or an empty vector)
------------------	--

**6.758.2.8** void decaf::net::ssl::SSLParameters::setWantClientAuth ( bool *wantClientAuth* ) [inline]

Sets whether client authentication should be requested.

Calling this method clears the needClientAuth flag.

#### Parameters

<i>whether</i>	client authentication should be requested.
----------------	--

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/SSLParameters.h

## 6.759 decaf::net::ssl::SSLServerSocket Class Reference

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.

```
#include <src/main/decaf/net/ssl/SSLServerSocket.h>
```

Inheritance diagram for decaf::net::ssl::SSLServerSocket:

### Public Member Functions

- virtual `~SSLServerSocket ()`
- virtual `std::vector< std::string > getSupportedCipherSuites () const =0`  
*Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 3662).*
- virtual `std::vector< std::string > getSupportedProtocols () const =0`  
*Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 3662) instance.*
- virtual `std::vector< std::string > getEnabledCipherSuites () const =0`  
*Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 3662).*

- virtual void `setNeedClientAuth (bool value)=0`  
*Sets whether or not this **Socket** (p. 3607) will require Client Authentication.*

## Protected Member Functions

- **SSLServerSocket** ()

*Creates a non-bound server socket.*

- **SSLServerSocket** (int port)

*Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.*

- **SSLServerSocket** (int port, int backlog)

*Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.*

- **SSLServerSocket** (int port, int backlog, const **decaf::net::InetAddress** \*address)

*Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.*

### 6.759.1 Detailed Description

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol. The main function of this class is to create **SSLSocket** (p. 3670) objects by accepting connections from client sockets over SSL.

#### Since

1.0

### 6.759.2 Constructor & Destructor Documentation

#### 6.759.2.1 decaf::net::ssl::SSLServerSocket::SSLServerSocket ( ) [protected]

Creates a non-bound server socket.

#### 6.759.2.2 decaf::net::ssl::SSLServerSocket::SSLServerSocket ( int port ) [protected]

Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 3644) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3635) is created.

#### Parameters

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
-------------	--

**Exceptions**

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentEx-ception</i>	if the port value is negative or greater than 65535.

### 6.759.2.3 `decaf::net::ssl::SSLServerSocket::SSLServerSocket ( int port, int backlog )` [protected]

Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3644) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3635) is created.

**Parameters**

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.

**Exceptions**

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentEx-ception</i>	if the port value is negative or greater than 65535.

### 6.759.2.4 `decaf::net::ssl::SSLServerSocket::SSLServerSocket ( int port, int backlog, const decaf::net::InetAddress * address )` [protected]

Creates a new **ServerSocket** (p. 3447) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the `ifAddress` is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3644) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3635) is created.

**Parameters**

<i>port</i>	The port to bind the <b>ServerSocket</b> (p. 3447) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.
<i>ifAddress</i>	The IP Address to bind to on the local machine.

**Exceptions**

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentEx-ception</i>	if the port value is negative or greater than 65535.

**6.759.2.5** virtual decaf::net::ssl::SSLServerSocket::~~SSLServerSocket ( ) [virtual]

**6.759.3 Member Function Documentation**

**6.759.3.1** virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledCipherSuites ( ) const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 3662).

**Returns**

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2933).

**6.759.3.2** virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledProtocols ( ) const [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 3662).

**Returns**

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2933).

**6.759.3.3** virtual bool decaf::net::ssl::SSLServerSocket::getNeedClientAuth ( ) const [pure virtual]

**Returns**

true if the **Socket** (p. 3607) requires client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2933).

```
6.759.3.4 virtual std::vector<std::string> de-
caf::net::ssl::SSLServerSocket::getSupportedCipherSuites ( )
const [pure virtual]
```

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 3662).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3607).

#### Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2933).

```
6.759.3.5 virtual std::vector<std::string> de-
caf::net::ssl::SSLServerSocket::getSupportedProtocols ( )
const [pure virtual]
```

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 3662) instance.

#### Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2934).

```
6.759.3.6 virtual bool decaf::net::ssl::SSLServerSocket::getWantClientAuth ( ) const [pure
virtual]
```

#### Returns

true if the **Socket** (p. 3607) request client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2934).

```
6.759.3.7 virtual void decaf::net::ssl::SSLServerSocket::setEnabledCipherSuites ( const
std::vector< std::string > & suites ) [pure virtual]
```

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 3662) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

#### Parameters

<i>suites</i>	An Vector of names for all the Cipher Suites that are to be enabled.
---------------	--

**Exceptions**

<i>IllegalArgumentEx- ception</i>	if the vector is empty or one of the names is invalid.
---------------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2934).

**6.759.3.8** `virtual void decaf::net::ssl::SSLServerSocket::setEnabledProtocols ( const  
std::vector< std::string > & protocols ) [pure virtual]`

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 3662) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

**Parameters**

<i>protocols</i>	An Vector of names for all the Protocols that are to be enabled.
------------------	--

**Exceptions**

<i>IllegalArgumentEx- ception</i>	if the vector is empty or one of the names is invalid.
---------------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2934).

**6.759.3.9** `virtual void decaf::net::ssl::SSLServerSocket::setNeedClientAuth ( bool value )  
[pure virtual]`

Sets whether or not this **Socket** (p. 3607) will require Client Authentication.

If set to true the **Socket** (p. 3607) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

**Parameters**

<i>value</i>	Whether the server socket should require client authentication.
--------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2935).

**6.759.3.10** `virtual void decaf::net::ssl::SSLServerSocket::setWantClientAuth ( bool value )  
[pure virtual]`

Sets whether or not this **Socket** (p. 3607) will request Client Authentication.

If set to true the **Socket** (p. 3607) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

**Parameters**

<i>value</i>	Whether the server socket should request client authentication.
--------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2935).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLServerSocket.h`

**6.760 decaf::net::ssl::SSLServerSocketFactory Class Reference**

Factory class interface that provides methods to create SSL Server Sockets.

```
#include <src/main/decaf/net/ssl/SSLServerSocketFactory.h>
```

Inheritance diagram for `decaf::net::ssl::SSLServerSocketFactory`:

**Public Member Functions**

- `virtual ~SSLServerSocketFactory ()`
- `virtual std::vector< std::string > getDefaultCipherSuites ()=0`  
*Returns the list of cipher suites which are enabled by default.*
- `virtual std::vector< std::string > getSupportedCipherSuites ()=0`  
*Returns the names of the cipher suites which could be enabled for use on an SSL connection.*

**Static Public Member Functions**

- `static ServerSocketFactory * getDefault ()`  
*Returns the current default SSL **ServerSocketFactory** (p. 3457), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

**Protected Member Functions**

- `SSLServerSocketFactory ()`

**6.760.1 Detailed Description**

Factory class interface that provides methods to create SSL Server Sockets.

**Since**

1.0

## 6.760.2 Constructor & Destructor Documentation

6.760.2.1 `decaf::net::ssl::SSLServerSocketFactory::SSLServerSocketFactory ( )`  
[protected]

6.760.2.2 `virtual decaf::net::ssl::SSLServerSocketFactory::~~SSLServerSocketFactory ( )`  
[virtual]

## 6.760.3 Member Function Documentation

6.760.3.1 `static ServerSocketFactory* decaf::net::ssl::SSLServerSocketFactory::getDefault ( )` [static]

Returns the current default SSL **ServerSocketFactory** (p. 3457), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns **SSLContext::getDefault()** (p. 3654)->**getServerSocketFactory()**. If that call fails, a non-functional factory is returned.

### Returns

the default SSL **ServerSocketFactory** (p. 3457) pointer.

### See also

**decaf::net::ssl::SSLContext::getDefault()** (p. 3654)

Reimplemented from **decaf::net::ServerSocketFactory** (p. 3460).

6.760.3.2 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getDefaultCipherSuites ( )` [pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

### Returns

an STL vector containing the list of cipher suites enabled by default.

### See also

**getSupportedCipherSuites()** (p. 3670)

Implemented in **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1749), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2940).

**6.760.3.3** `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getSupportedCipherSuites ( ) [pure virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

### Returns

an STL vector containing the list of supported cipher suites.

### See also

`getDefaultCipherSuites()` (p. 3669)

Implemented in `decaf::internal::net::ssl::DefaultSSLServerSocketFactory` (p. 1749), and `decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory` (p. 2940).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLServerSocketFactory.h`

## 6.761 decaf::net::ssl::SSLSocket Class Reference

```
#include <src/main/decaf/net/ssl/SSLSocket.h>
```

Inheritance diagram for `decaf::net::ssl::SSLSocket`:

### Public Member Functions

- **SSLSocket** ()
- **SSLSocket** (const **InetAddress** \*address, int port)  
*Creates a new **SSLSocket** (p. 3670) instance and connects it to the given address and port.*
- **SSLSocket** (const **InetAddress** \*address, int port, const **InetAddress** \*localAddress, int localPort)  
*Creates a new **SSLSocket** (p. 3670) instance and connects it to the given address and port.*
- **SSLSocket** (const std::string &host, int port)  
*Creates a new **SSLSocket** (p. 3670) instance and connects it to the given host and port.*

- **SSLSocket** (const std::string &host, int port, const **InetAddress** \*localAddress, int localPort)  
*Creates a new **SSLSocket** (p. 3670) instance and connects it to the given host and port.*
- virtual ~**SSLSocket** ()
- virtual std::vector< std::string > **getSupportedCipherSuites** () const =0  
*Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3670).*
- virtual std::vector< std::string > **getSupportedProtocols** () const =0  
*Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3670) instance.*
- virtual std::vector< std::string > **getEnabledCipherSuites** () const =0  
*Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSL Socket** (p. 3607).*
- virtual void **setEnabledCipherSuites** (const std::vector< std::string > &suites)=0  
*Sets the Cipher Suites that are to be enabled on the **SSL Socket** (p. 3607) connection.*
- virtual std::vector< std::string > **getEnabledProtocols** () const =0  
*Returns a vector containing the names of all the currently enabled Protocols for this **SSL Socket** (p. 3607).*
- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)=0  
*Sets the Protocols that are to be enabled on the **SSL Socket** (p. 3607) connection.*
- virtual **SSLParameters** **getSSLParameters** () const  
*Returns an **SSLParameters** (p. 3658) object for this **SSLSocket** (p. 3670) instance.*
- virtual void **setSSLParameters** (const **SSLParameters** &value)  
*Sets the **SSLParameters** (p. 3658) for this **SSLSocket** (p. 3670) using the supplied **SSLParameters** (p. 3658) instance.*
- virtual void **startHandshake** ()=0  
*Initiates a handshake for this **SSL Connection**, this can be necessary for several reasons such as using new encryption keys, or starting a new session.*
- virtual void **setUseClientMode** (bool value)=0  
*Determines the mode that the socket uses when a handshake is initiated, client or server.*
- virtual bool **getUseClientMode** () const =0

*Gets whether this **Socket** (p. 3607) is in Client or Server mode, true indicates that the mode is set to Client.*

- virtual void **setNeedClientAuth** (bool value)=0  
*Sets the **Socket** (p. 3607) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
- virtual bool **getNeedClientAuth** () const =0  
*Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.*
- virtual void **setWantClientAuth** (bool value)=0  
*Sets the **Socket** (p. 3607) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
- virtual bool **getWantClientAuth** () const =0  
*Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.*

### 6.761.1 Detailed Description

Since

1.0

### 6.761.2 Constructor & Destructor Documentation

6.761.2.1 **decaf::net::ssl::SSLSocket::SSLSocket ( )**

6.761.2.2 **decaf::net::ssl::SSLSocket::SSLSocket ( const InetAddress \* address, int port )**

Creates a new **SSLSocket** (p. 3670) instance and connects it to the given address and port.

If the host parameter is empty then the loop back address is used.

#### Parameters

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]

#### Exceptions

<b>UnknownHostException</b> (p. 4019)	if the host cannot be resolved.
<b>IOException</b>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).

<i>NullPointerException</i>	if the <b>InetAddress</b> (p. 2077) instance is NULL.
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

#### 6.761.2.3 decaf::net::ssl::SSLSocket::SSLSocket ( const InetAddress \* address, int port, const InetAddress \* localAddress, int localPort )

Creates a new **SSLSocket** (p. 3670) instance and connects it to the given address and port.

The **Socket** (p. 3607) will also bind to the local address and port specified.

##### Parameters

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]
<i>localAddress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

##### Exceptions

<i>UnknownHostException</i> (p. 4019)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<i>NullPointerException</i>	if the <b>InetAddress</b> (p. 2077) instance is NULL.
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

#### 6.761.2.4 decaf::net::ssl::SSLSocket::SSLSocket ( const std::string & host, int port )

Creates a new **SSLSocket** (p. 3670) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

##### Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loopback.
<i>port</i>	The port number to connect to [0...65535]

##### Exceptions

<i>UnknownHostException</i> (p. 4019)	if the host cannot be resolved.
--	---------------------------------

<i>IOException</i>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<i>IllegalArgumentEx- ception</i>	if the port if not in range [0...65535]

#### 6.761.2.5 `decaf::net::ssl::SSLSocket::SSLSocket ( const std::string & host, int port, const InetAddress * localAddress, int localPort )`

Creates a new **SSLSocket** (p. 3670) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

##### Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loopback.
<i>port</i>	The port number to connect to [0...65535]
<i>localAd- dress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

##### Exceptions

<i>UnknownHostEx- ception</i> (p. 4019)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the <b>Socket</b> (p. 3607).
<i>IllegalArgumentEx- ception</i>	if the port if not in range [0...65535]

#### 6.761.2.6 `virtual decaf::net::ssl::SSLSocket::~~SSLSocket ( ) [virtual]`

### 6.761.3 Member Function Documentation

#### 6.761.3.1 `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledCipherSuites ( ) const [pure virtual]`

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSL Socket** (p. 3607).

##### Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2947).

**6.761.3.2** `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledProtocols ( ) const [pure virtual]`

Returns a vector containing the names of all the currently enabled Protocols for this **SSL Socket** (p. 3607).

#### Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2948).

**6.761.3.3** `virtual bool decaf::net::ssl::SSLSocket::getNeedClientAuth ( ) const [pure virtual]`

Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

#### Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2948).

**6.761.3.4** `virtual SSLParameters decaf::net::ssl::SSLSocket::getSSLParameters ( ) const [virtual]`

Returns an **SSLParameters** (p. 3658) object for this **SSLSocket** (p. 3670) instance.

The cipherSuites and protocols vectors in the returned **SSLParameters** (p. 3658) reference will never be empty.

#### Returns

an **SSLParameters** (p. 3658) object with the settings in use for the **SSLSocket** (p. 3670).

**6.761.3.5** `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedCipherSuites ( ) const [pure virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3670).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3607).

#### Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2949).

**6.761.3.6** `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedProtocols ( ) const [pure virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3670) instance.

#### Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2949).

**6.761.3.7** `virtual bool decaf::net::ssl::SSLSocket::getUseClientMode ( ) const [pure virtual]`

Gets whether this **Socket** (p. 3607) is in Client or Server mode, true indicates that the mode is set to Client.

#### Returns

true if the **Socket** (p. 3607) is in Client mode, false otherwise.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2950).

**6.761.3.8** `virtual bool decaf::net::ssl::SSLSocket::getWantClientAuth ( ) const [pure virtual]`

Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

#### Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2950).

**6.761.3.9** `virtual void decaf::net::ssl::SSLSocket::setEnabledCipherSuites ( const std::vector<std::string> & suites ) [pure virtual]`

Sets the Cipher Suites that are to be enabled on the **SSL Socket** (p. 3607) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

**Parameters**

<i>suites</i>	An Vector of names for all the Cipher Suites that are to be enabled.
---------------	--

**Exceptions**

<i>IllegalArgumentEx- ception</i>	if the vector is empty or one of the names is invalid.
---------------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2951).

**6.761.3.10** `virtual void decaf::net::ssl::SSLSocket::setEnabledProtocols ( const std::vector< std::string > & protocols ) [pure virtual]`

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 3607) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

**Parameters**

<i>protocols</i>	An Vector of names for all the Protocols that are to be enabled.
------------------	--

**Exceptions**

<i>IllegalArgumentEx- ception</i>	if the vector is empty or one of the names is invalid.
---------------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2951).

**6.761.3.11** `virtual void decaf::net::ssl::SSLSocket::setNeedClientAuth ( bool value ) [pure virtual]`

Sets the **Socket** (p. 3607) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

**Parameters**

<i>value</i>	The value indicating if a client is required to authenticate itself or not.
--------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2952).

**6.761.3.12** `virtual void decaf::net::ssl::SSLSocket::setSSLParameters ( const SSLParameters & value )` [virtual]

Sets the **SSLParameters** (p. 3658) for this **SSLSocket** (p. 3670) using the supplied **SSLParameters** (p. 3658) instance.

If the cipherSuites vector in the **SSLParameters** (p. 3658) instance is not empty then the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 3658) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.

#### Parameters

<i>value</i>	The <b>SSLParameters</b> (p. 3658) instance that is used to update this <b>SSLSocket</b> 's settings.
--------------	---

#### Exceptions

<i>IllegalArgumentEx- ception</i>	if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.
---------------------------------------	---

**6.761.3.13** `virtual void decaf::net::ssl::SSLSocket::setUseClientMode ( bool value )` [pure virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 3607), once a handshake has been initiated this socket remains in the set mode; client or server, for the life of this object.

#### Parameters

<i>value</i>	The mode setting, true for client or false for server.
--------------	--

#### Exceptions

<i>IllegalArgumentEx- ception</i>	if the handshake process has begun and mode is locked.
---------------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2953).

**6.761.3.14** `virtual void decaf::net::ssl::SSLSocket::setWantClientAuth ( bool value )` [pure virtual]

Sets the **Socket** (p. 3607) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled and the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the `setNeedClientAuth` method.

#### Parameters

<i>value</i>	The value indicating if a client is requested to authenticate itself or not.
--------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2953).

**6.761.3.15** `virtual void decaf::net::ssl::SSLSocket::startHandshake ( )` [pure virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not required to support multiple handshakes and can throw an `IOException` to indicate an error.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while performing the Handshake
--------------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2954).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLSocket.h`

## 6.762 decaf::net::ssl::SSLSocketFactory Class Reference

Factory class interface for a **SocketFactory** (p. 3629) that can create **SSLSocket** (p. 3670) objects.

```
#include <src/main/decaf/net/ssl/SSLSocketFactory.h>
```

Inheritance diagram for `decaf::net::ssl::SSLSocketFactory`:

#### Public Member Functions

- `virtual ~SSLSocketFactory ()`
- `virtual std::vector< std::string > getDefaultCipherSuites ()=0`  
Returns the list of cipher suites which are enabled by default.

- virtual `std::vector< std::string > getSupportedCipherSuites ()=0`  
*Returns the names of the cipher suites which could be enabled for use on an SSL connection.*
- virtual `Socket * createSocket (Socket *socket, std::string host, int port, bool autoClose)=0`  
*Returns a socket layered over an existing socket connected to the named host, at the given port.*

### Static Public Member Functions

- static `SocketFactory * getDefault ()`  
*Returns the current default SSL **SocketFactory** (p. 3629), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

### Protected Member Functions

- `SSLSocketFactory ()`

#### 6.762.1 Detailed Description

Factory class interface for a **SocketFactory** (p. 3629) that can create **SSLSocket** (p. 3670) objects.

Since

1.0

#### 6.762.2 Constructor & Destructor Documentation

6.762.2.1 `decaf::net::ssl::SSLSocketFactory::SSLSocketFactory ( )` [protected]

6.762.2.2 `virtual decaf::net::ssl::SSLSocketFactory::~SSLSocketFactory ( )` [virtual]

#### 6.762.3 Member Function Documentation

6.762.3.1 `virtual Socket* decaf::net::ssl::SSLSocketFactory::createSocket ( Socket * socket, std::string host, int port, bool autoClose )` [pure virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

**Parameters**

<i>socket</i>	The existing socket to layer over.
<i>host</i>	The server host the original <b>Socket</b> (p. 3607) is connected to.
<i>port</i>	The server port the original <b>Socket</b> (p. 3607) is connected to.
<i>autoClose</i>	Should the layered over <b>Socket</b> (p. 3607) be closed when the topmost socket is closed.

**Returns**

a new **Socket** (p. 3607) instance that wraps the given **Socket** (p. 3607).

**Exceptions**

<i>IOException</i>	if an I/O exception occurs while performing this operation.
<i>UnknownHostException</i> (p. 4019)	if the host is unknown.

Implemented in **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1753), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2962).

**6.762.3.2 static SocketFactory\* decaf::net::ssl::SSLSocketFactory::getDefault ( )**  
[static]

Returns the current default SSL **SocketFactory** (p. 3629), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns **SSLContext::getDefault()** (p. 3654)->**getSocketFactory()**. If that call fails, a non-functional factory is returned.

**Returns**

the default SSL **SocketFactory** (p. 3629) pointer.

**See also**

**decaf::net::ssl::SSLContext::getDefault()** (p. 3654)

Reimplemented from **decaf::net::SocketFactory** (p. 3633).

**6.762.3.3 virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getDefaultCipherSuites ( )**  
[pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

**Returns**

an STL vector containing the list of cipher suites enabled by default.

**See also**

**getSupportedCipherSuites()** (p. 3682)

Implemented in **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1756), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2965).

```
6.762.3.4  virtual std::vector<std::string> de-
            caf::net::ssl::SSLSocketFactory::getSupportedCipherSuites ( )
            [pure virtual]
```

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

**Returns**

an STL vector containing the list of supported cipher suites.

**See also**

**getDefaultCipherSuites()** (p. 3681)

Implemented in **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1757), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2966).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLSocketFactory.h`

## 6.763 activemq::transport::tcp::SslTransport Class Reference

**Transport** (p. 3996) for connecting to a Broker using an SSL Socket.

```
#include <src/main/activemq/transport/tcp/SslTransport.h>
```

Inheritance diagram for `activemq::transport::tcp::SslTransport`:

**Public Member Functions**

- **SslTransport** (const **Pointer**< **Transport** > &next)

*Creates a new instance of the **SslTransport** (p. 3682), the transport will not attempt to connect to a remote host until the connect method is called.*

- virtual `~SslTransport()`

### Protected Member Functions

- virtual `decaf::net::Socket * createSocket()`

*Create an unconnected Socket instance to be used by the transport to communicate with the broker.*

#### Returns

*a newly created unconnected Socket instance.*

#### Exceptions

IOException	<i>if there is an error while creating the unconnected Socket.</i>
-------------	--

- virtual void `configureSocket(decaf::net::Socket *socket, decaf::util::Properties &properties)`

### 6.763.1 Detailed Description

**Transport** (p. 3996) for connecting to a Broker using an SSL Socket. This transport simply wraps the **TcpTransport** (p. 3865) and provides the **TcpTransport** (p. 3865) an SSL based Socket pointer allowing the core **TcpTransport** (p. 3865) logic to be reused.

#### Since

3.2.0

### 6.763.2 Constructor & Destructor Documentation

#### 6.763.2.1 `activemq::transport::tcp::SslTransport::SslTransport(const Pointer<Transport> &next)`

Creates a new instance of the **SslTransport** (p. 3682), the transport will not attempt to connect to a remote host until the connect method is called.

#### Parameters

<i>next</i>	the next transport in the chain
-------------	---------------------------------

6.763.2.2 `virtual activemq::transport::tcp::SslTransport::~~SslTransport ( ) [virtual]`

### 6.763.3 Member Function Documentation

6.763.3.1 `virtual void activemq::transport::tcp::SslTransport::configureSocket ( decaf::net::Socket * socket, decaf::util::Properties & properties ) [protected, virtual]`

6.763.3.2 `virtual decaf::net::Socket* activemq::transport::tcp::SslTransport::createSocket ( ) [protected, virtual]`

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

#### Returns

a newly created unconnected Socket instance.

#### Exceptions

<i>IOException</i>	if there is an error while creating the unconnected Socket.
--------------------	---

Reimplemented from `activemq::transport::tcp::TcpTransport` (p. 3868).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/tcp/SslTransport.h`

## 6.764 `activemq::transport::tcp::SslTransportFactory` Class Reference

```
#include <src/main/activemq/transport/tcp/SslTransportFactory.h>
```

Inheritance diagram for `activemq::transport::tcp::SslTransportFactory`:

### Public Member Functions

- `virtual ~SslTransportFactory ()`

### Protected Member Functions

- `virtual Pointer< Transport > doCreateComposite (const decaf::net::URI &location, const Pointer< wireformat::WireFormat > &wireFormat, const decaf::util::Properties &properties) throw ( exceptions::ActiveMQException )`

*Creates a slimmed down **Transport** (p. 3996) instance which can be used in composite transport instances.*

## 6.765 activemq::commands::BrokerError::StackTraceElement Struct Reference 3689

### 6.764.1 Constructor & Destructor Documentation

6.764.1.1 virtual activemq::transport::tcp::SslTransportFactory::~SslTransportFactory ( )  
[virtual]

### 6.764.2 Member Function Documentation

6.764.2.1 virtual Pointer<Transport> activemq::transport::tcp::SslTransportFactory::doCreateComposite ( const decaf::net::URI & *location*, const Pointer<wireformat::WireFormat> & *wireFormat*, const decaf::util::Properties & *properties* ) throw ( exceptions::ActiveMQException ) [protected, virtual]

Creates a slimed down **Transport** (p. 3996) instance which can be used in composite transport instances.

#### Parameters

<i>location</i>	- URI location to connect to.
<i>wireFormat</i>	- the assigned WireFormat for the new <b>Transport</b> (p. 3996).
<i>properties</i>	- Properties to apply to the transport.

#### Returns

new Pointer to a **SslTransport** (p. 3682).

#### Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Reimplemented from **activemq::transport::tcp::TcpTransportFactory** (p. 3871).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/SslTransportFactory.h

## 6.765 activemq::commands::BrokerError::StackTraceElement Struct Reference

```
#include <src/main/activemq/commands/BrokerError.h>
```

#### Data Fields

- std::string **ClassName**
- std::string **FileName**
- std::string **MethodName**
- int **LineNumber**

### 6.765.1 Field Documentation

6.765.1.1 `std::string activemq::commands::BrokerError::StackTraceElement::ClassName`

6.765.1.2 `std::string activemq::commands::BrokerError::StackTraceElement::FileName`

6.765.1.3 `int activemq::commands::BrokerError::StackTraceElement::LineNumber`

6.765.1.4 `std::string activemq::commands::BrokerError::StackTraceElement::MethodName`

The documentation for this struct was generated from the following file:

- `src/main/activemq/commands/BrokerError.h`

### 6.766 `decaf::internal::io::StandardErrorOutputStream` Class Reference

Wrapper Around the Standard error Output facility on the current platform.

```
#include <src/main/decaf/internal/io/StandardErrorOutputStream.h>
```

Inheritance diagram for `decaf::internal::io::StandardErrorOutputStream`:

#### Public Member Functions

- `StandardErrorOutputStream ()`
- `virtual ~StandardErrorOutputStream ()`
- `virtual void flush () throw ( decaf::io::IOException )`

*Flushes this stream by writing any buffered output to the underlying stream.*

**Exceptions**

<b>IOException</b> (p. 2210)   <i>if an I/O error occurs.</i>
---

*The default implementation of this method does nothing.*

- `virtual void close () throw ( decaf::io::IOException )`

*Closes this object and deallocates the appropriate resources.*

*The object is generally no longer usable after calling close.*

**Exceptions**

<b>IOException</b> (p. 2210)   <i>if an error occurs while closing.</i>
---

*The default implementation of this method does nothing.*

## Protected Member Functions

- virtual void **doWriteByte** (unsigned char value) throw ( decaf::io::IOException )
- virtual void **doWriteArrayBounded** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

### 6.766.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform. This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

### 6.766.2 Constructor & Destructor Documentation

6.766.2.1 `decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream ( )`

6.766.2.2 `virtual decaf::internal::io::StandardErrorOutputStream::~~StandardErrorOutputStream ( ) [virtual]`

### 6.766.3 Member Function Documentation

6.766.3.1 `virtual void decaf::internal::io::StandardErrorOutputStream::close ( ) throw ( decaf::io::IOException ) [virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

## Exceptions

<i><b>IOException</b></i> (p. 2210)	if an error occurs while closing.
--	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2993).

6.766.3.2 `virtual void decaf::internal::io::StandardErrorOutputStream::doWriteArrayBounded ( const unsigned char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException ) [protected, virtual]`

Reimplemented from **decaf::io::OutputStream** (p. 2994).

6.766.3.3 `virtual void decaf::internal::io::StandardOutputStream::doWriteByte ( unsigned char value ) throw ( decaf::io::IOException )` [protected, virtual]

Implements `decaf::io::OutputStream` (p. 2994).

6.766.3.4 `virtual void decaf::internal::io::StandardOutputStream::flush ( ) throw ( decaf::io::IOException )` [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

#### Exceptions

<i><b>IOException</b></i> (p. 2210)	if an I/O error occurs.
--	-------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from `decaf::io::OutputStream` (p. 2994).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/io/StandardOutputStream.h`

## 6.767 decaf::internal::io::StandardInputStream Class Reference

```
#include <src/main/decaf/internal/io/StandardInputStream.h>
```

Inheritance diagram for `decaf::internal::io::StandardInputStream`:

#### Public Member Functions

- `StandardInputStream ()`
- `virtual ~StandardInputStream ()`
- `virtual int available () const throw ( decaf::io::IOException )`

*Indicates the number of bytes available.*

#### Protected Member Functions

- `virtual int doReadByte () throw ( decaf::io::IOException )`

### 6.767.1 Constructor & Destructor Documentation

6.767.1.1 `decaf::internal::io::StandardInputStream::StandardInputStream ( )`

6.767.1.2 `virtual decaf::internal::io::StandardInputStream::~~StandardInputStream ( )`  
[virtual]

### 6.767.2 Member Function Documentation

6.767.2.1 `virtual int decaf::internal::io::StandardInputStream::available ( ) const throw ( decaf::io::IOException )` [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

#### Returns

the number of bytes available on this input stream.

#### Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

Reimplemented from `decaf::io::InputStream` (p. 2107).

6.767.2.2 `virtual int decaf::internal::io::StandardInputStream::doReadByte ( ) throw ( decaf::io::IOException )` [protected, virtual]

Implements `decaf::io::InputStream` (p. 2109).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/io/StandardInputStream.h`

## 6.768 decaf::internal::io::StandardOutputStream Class Reference

```
#include <src/main/decaf/internal/io/StandardOutputStream.h>
```

Inheritance diagram for `decaf::internal::io::StandardOutputStream`:

## Public Member Functions

- **StandardOutputStream** ()
- virtual **~StandardOutputStream** ()
- virtual void **flush** () throw ( decaf::io::IOException )

*Flushes this stream by writing any buffered output to the underlying stream.*

### Exceptions

<b>IOException</b> (p. 2210)	if an I/O error occurs.
------------------------------	-------------------------

*The default implementation of this method does nothing.*

- virtual void **close** () throw ( decaf::io::IOException )

*Closes this object and deallocates the appropriate resources.*

*The object is generally no longer usable after calling close.*

### Exceptions

<b>IOException</b> (p. 2210)	if an error occurs while closing.
------------------------------	-----------------------------------

*The default implementation of this method does nothing.*

## Protected Member Functions

- virtual void **doWriteByte** (unsigned char value) throw ( decaf::io::IOException )
- virtual void **doWriteArrayBounded** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

## 6.768.1 Constructor & Destructor Documentation

6.768.1.1 **decaf::internal::io::StandardOutputStream::StandardOutputStream** ( )

6.768.1.2 **virtual decaf::internal::io::StandardOutputStream::~~StandardOutputStream** ( )  
[virtual]

## 6.768.2 Member Function Documentation

6.768.2.1 **virtual void decaf::internal::io::StandardOutputStream::close** ( ) throw ( **decaf::io::IOException** ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

### Exceptions

<b>IOException</b> (p. 2210)	if an error occurs while closing.
---------------------------------	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2993).

**6.768.2.2** virtual void decaf::internal::io::StandardOutputStream::doWriteArrayBounded ( const unsigned char \* *buffer*, int *size*, int *offset*, int *length* ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )  
[protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2994).

**6.768.2.3** virtual void decaf::internal::io::StandardOutputStream::doWriteByte ( unsigned char *value* ) throw ( decaf::io::IOException ) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2994).

**6.768.2.4** virtual void decaf::internal::io::StandardOutputStream::flush ( ) throw ( decaf::io::IOException ) [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

### Exceptions

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2994).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/StandardOutputStream.h

## 6.769 cms::Startable Class Reference

Interface for a class that implements the start method.

```
#include <src/main/cms/Startable.h>
```

Inheritance diagram for cms::Startable:

## Public Member Functions

- virtual `~Startable()`
- virtual void `start()`=0 throw ( `CMSEException` )

*Starts the service.*

### 6.769.1 Detailed Description

Interface for a class that implements the start method. An object that implements the **Startable** (p. 3691) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since

1.0

### 6.769.2 Constructor & Destructor Documentation

6.769.2.1 virtual `cms::Startable::~~Startable()` [inline, virtual]

### 6.769.3 Member Function Documentation

6.769.3.1 virtual void `cms::Startable::start()` throw ( `CMSEException` ) [pure virtual]

Starts the service.

### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	if an internal error occurs while starting.
--	---

Implemented in **activemq::core::ActiveMQConnection** (p. 280).

The documentation for this class was generated from the following file:

- `src/main/cms/Startable.h`

## 6.770 decaf::lang::STATIC\_CAST\_TOKEN Struct Reference

```
#include <src/main/decaf/lang/Pointer.h>
```

The documentation for this struct was generated from the following file:

- `src/main/decaf/lang/Pointer.h`

## 6.771 activemq::core::ActiveMQConstants::StaticInitializer Class Reference

```
#include <src/main/activemq/core/ActiveMQConstants.h>
```

### Public Member Functions

- **StaticInitializer** ()
- virtual **~StaticInitializer** ()

### Static Public Attributes

- static std::string **destOptions** [NUM\_OPTIONS]
- static std::string **uriParams** [NUM\_PARAMS]
- static std::map< std::string, **DestinationOption** > **destOptionMap**
- static std::map< std::string, **URIParam** > **uriParamsMap**

### 6.771.1 Constructor & Destructor Documentation

6.771.1.1 **activemq::core::ActiveMQConstants::StaticInitializer::StaticInitializer** ( )

6.771.1.2 **virtual activemq::core::ActiveMQConstants::StaticInitializer::~~StaticInitializer** ( )  
[inline, virtual]

### 6.771.2 Field Documentation

6.771.2.1 **std::map<std::string, DestinationOption>**  
**activemq::core::ActiveMQConstants::StaticInitializer::destOptionMap**  
[static]

6.771.2.2 **std::string activemq::core::ActiveMQConstants::StaticInitializer::destOptions**[NUM\_OPTIONS]  
[static]

6.771.2.3 **std::string activemq::core::ActiveMQConstants::StaticInitializer::uriParams**[NUM\_PARAMS]  
[static]

6.771.2.4 **std::map<std::string, URIParam>** **activemq::core::ActiveMQConstants::StaticInitializer::uriParamsMap**

## 6.772 decaf::util::StlList< E > Class Template Reference

**List** (p. 2409) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

```
#include <src/main/decaf/util/StlList.h>
```

Inheritance diagram for decaf::util::StlList< E >:

### Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

### Public Member Functions

- **StlList** ()  
*Default constructor - does nothing.*
- **StlList** (const **StlList** &source)  
*Copy constructor - copies the content of the given set into this one.*
- **StlList** (const **Collection**< E > &source)  
*Copy constructor - copies the content of the given set into this one.*
- virtual **~StlList** ()
- virtual bool **equals** (const **StlList** &source) const
- virtual **Iterator**< E > \* **iterator** ()  
*Returns*  
*an iterator over a set of elements of type T.*
- virtual **Iterator**< E > \* **iterator** () const
- virtual **ListIterator**< E > \* **listIterator** ()  
*Returns*  
*a list iterator over the elements in this list (in proper sequence).*
- virtual **ListIterator**< E > \* **listIterator** () const
- virtual **ListIterator**< E > \* **listIterator** (std::size\_t index) throw ( decaf::lang::exceptions::IndexOutOfBo  
)

#### Parameters

index	<i>index of first element to be returned from the list iterator (by a call to the next method).</i>
-------	---

**Returns**

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

**Exceptions**

IndexOutOfBoundsException	if the index is out of range ( $\text{index} < 0 \parallel \text{index} > \text{size}()$ (p. 1226))
---------------------------	---

- virtual **ListIterator**< E > \* **listIterator** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException )
- virtual void **copy** (const **StlList** &source)

- virtual void **clear** () throw ( lang::exceptions::UnsupportedOperationException )

*Removes all of the elements from this collection (optional operation).*

*The collection will be empty after this method returns.*

*This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 2223) operation. Most implementations will probably choose to override this method for efficiency.*

*Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

**Exceptions**

UnsupportedOperationException	if the clear operation is not supported by this collection
-------------------------------	--

- virtual bool **contains** (const E &value) const throw ( lang::Exception )

*Returns true if this collection contains the specified element.*

*This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.*

**Parameters**

value	- the value whose presence is to be queried for in this <b>Collection</b> (p. 1216).
-------	--

**Returns**

*true if the value is contained in this collection*

**Exceptions**

Exception	if an error occurs,
-----------	---------------------

- virtual std::size\_t **indexOf** (const E &value) throw ( decaf::lang::exceptions::NoSuchElementException )

*Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.*

*More formally, returns the lowest index i such that  $\text{get}(i) == \text{value}$ , or -1 if there is no such index.*

**Parameters**

value	- element to search for
-------	-------------------------

**Returns**

*the index of the first occurrence of the specified element in this list,*

**Exceptions**

NoSuchElementException	if value is not in the list
------------------------	-----------------------------

- virtual std::size\_t **lastIndexOf**(const E &value) throw ( decaf::lang::exceptions::NoSuchElementException )

*Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.*

*More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.*

**Parameters**

value	- element to search for
-------	-------------------------

**Returns**

*the index of the last occurrence of the specified element in this list.*

**Exceptions**

NoSuchElementException	if value is not in the list
------------------------	-----------------------------

- virtual bool **isEmpty** () const

*Returns true if this collection contains no elements.*

*This implementation returns size() (p. 1226) == 0.*

**Returns**

*true if the size method return 0.*

- virtual std::size\_t **size** () const

*Returns the number of elements in this collection.*

*If this collection contains more than Integer.MAX\_VALUE elements, returns Integer.MAX\_VALUE.*

**Returns**

*the number of elements in this collection*

- virtual E **get** (std::size\_t index) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException )

*Gets the element contained at position passed.*

**Parameters**

index	- position to get
-------	-------------------

**Returns**

*value at index*

- virtual E **set** (std::size\_t index, const E &element) throw ( decaf::lang::exceptions::IndexOutOfBoundsException )

*Replaces the element at the specified position in this list with the specified element.*

**Parameters**

index	- index of the element to replace
element	- element to be stored at the specified position

**Returns**

*the element previously at the specified position*

**Exceptions**

IndexOutOfBoundsException	- if the index is greater than size
---------------------------	-------------------------------------

- virtual bool **add** (const E &value) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException )

*Returns true if this collection changed as a result of the call.*

*(Returns false if this collection does not permit duplicates and already contains the specified element.)*

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1216) classes should clearly specify in their documentation any restrictions on what elements may be added.*

*If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.*

*For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.*

**Parameters**

value	- reference to the element to add.
-------	------------------------------------

**Returns**

*true if the element was added*

**Exceptions**

UnsupportedOperationException	
IllegalArgumentException	
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions</i>

- virtual void **add** (std::size\_t index, const E &element) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException )

*Inserts the specified element at the specified position in this list.*

*Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).*

**Parameters**

index	- index at which the specified element is to be inserted
element	- element to be inserted

**Exceptions**

IndexOutOfBoundsException	- if the index is greater than size
UnsupportedOperationException	- If the collection is non-modifiable.

- virtual bool **addAll** (std::size\_t index, const **Collection**< E > &source) throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException )

*Inserts all of the elements in the specified collection into this list at the specified position (optional operation).*

*Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)*

**Parameters**

index	The index at which to insert the first element from the specified collection
source	The <b>Collection</b> (p. 1216) containing elements to be added to this list

**Returns**

*true if this list changed as a result of the call*

**Exceptions**

IndexOutOfBoundsException	- if the index is greater than size
UnsupportedOperationException	- If the collection is non-modifiable.

- virtual bool **remove** (const E &value) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException )

*Removes a single instance of the specified element from this collection, if it is present (optional operation).*

*More formally, removes the first element *e* such that *e == o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).*

*This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.*

*Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.*

**Parameters**

value	- element to be removed from this collection, if present
-------	--

**Returns**

*true if an element was removed as a result of this call*

**Exceptions**

UnsupportedOperationException	<i>if the remove operation is not supported by this collection.</i>
IllegalArgumentException	<i>If the value is not a valid entry for this <b>Collection</b> (p. 1216).</i>

- virtual E **remove** (std::size\_t index) throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException )

*Removes the element at the specified position in this list.*

*Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.*

**Parameters**

index	- the index of the element to be removed
-------	--

**Returns**

*the element previously at the specified position*

**Exceptions**

IndexOutOfBoundsException	- <i>if the index is greater than size</i>
UnsupportedOperationException	- <i>If the collection is non-modifiable.</i>

**6.772.1 Detailed Description**

`template<typename E> class decaf::util::StlList< E >`

**List** (p. 2409) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

**6.772.2 Constructor & Destructor Documentation**

**6.772.2.1** `template<typename E> decaf::util::StlList< E >::StlList ( ) [inline]`

Default constructor - does nothing.

**6.772.2.2** `template<typename E> decaf::util::StlList< E >::StlList ( const StlList< E > & source ) [inline]`

Copy constructor - copies the content of the given set into this one.

**Parameters**

<i>source</i>	The source set.
---------------	-----------------

**6.772.2.3** `template<typename E> decaf::util::StlList< E >::StlList ( const Collection< E > & source ) [inline]`

Copy constructor - copies the content of the given set into this one.

**Parameters**

<i>source</i>	The source set.
---------------	-----------------

**6.772.2.4** `template<typename E> virtual decaf::util::StlList< E >::~~StlList ( ) [inline, virtual]`

**6.772.3 Member Function Documentation**

**6.772.3.1** `template<typename E> virtual bool decaf::util::StlList< E >::add ( const E & value ) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException ) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1216) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

**Parameters**

<i>value</i>	- reference to the element to add.
--------------	------------------------------------

**Returns**

true if the element was added

**Exceptions**

<i>UnsupportedOperationException</i>	
<i>IllegalArgumentException</i>	
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 1218).

Referenced by decaf::util::StlList< cms::Connection \* >::addAll().

**6.772.3.2** `template<typename E> virtual void decaf::util::StlList< E >::add ( std::size_t index, const E & element ) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException ) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

**Parameters**

<i>index</i>	- index at which the specified element is to be inserted
<i>element</i>	- element to be inserted

**Exceptions**

<i>IndexOutOfBoundsException</i>	- if the index is greater than size
<i>UnsupportedOperationException</i>	- If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 2410).

**6.772.3.3** `template<typename E> virtual bool decaf::util::StlList< E >::addAll ( std::size_t index, const Collection< E > & source ) throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException ) [inline, virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation

is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

#### Parameters

<i>index</i>	The index at which to insert the first element from the specified collection
<i>source</i>	The <b>Collection</b> (p. 1216) containing elements to be added to this list

#### Returns

true if this list changed as a result of the call

#### Exceptions

<i>IndexOutOfBoundsException</i>	- if the index is greater than size
<i>UnsupportedOperationException</i>	- If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 2411).

**6.772.3.4** `template<typename E> virtual void decaf::util::StlList< E >::clear ( ) throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 2223) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

#### Exceptions

<i>UnsupportedOperationException</i>	if the clear operation is not supported by this collection
--------------------------------------	--

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 163).

**6.772.3.5** `template<typename E> virtual bool decaf::util::StlList< E >::contains ( const E & value ) const throw ( lang::Exception ) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

**Parameters**

<i>value</i>	- the value whose presence is to be queried for in this <b>Collection</b> (p. 1216).
--------------	--

**Returns**

true if the value is contained in this collection

**Exceptions**

<i>Exception</i>	if an error occurs,
------------------	---------------------

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 164).

**6.772.3.6** `template<typename E> virtual void decaf::util::StlList< E >::copy ( const StlList< E > & source ) [inline, virtual]`

Referenced by `decaf::util::StlList< cms::Connection * >::StlList()`.

**6.772.3.7** `template<typename E> virtual bool decaf::util::StlList< E >::equals ( const StlList< E > & source ) const [inline, virtual]`

**6.772.3.8** `template<typename E> virtual E decaf::util::StlList< E >::get ( std::size_t index ) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException ) [inline, virtual]`

Gets the element contained at position passed.

**Parameters**

<i>index</i>	- position to get
--------------	-------------------

**Returns**

value at index

Implements **decaf::util::List< E >** (p. 2412).

**6.772.3.9** `template<typename E> virtual std::size_t decaf::util::StlList< E >::indexOf ( const E & value ) throw ( decaf::lang::exceptions::NoSuchElementException ) [inline, virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

**Parameters**

<i>value</i>	- element to search for
--------------	-------------------------

**Returns**

the index of the first occurrence of the specified element in this list,

**Exceptions**

<i>NoSuchElementException</i>	if value is not in the list
-------------------------------	-----------------------------

Implements **decaf::util::List< E >** (p. 2412).

**6.772.3.10** `template<typename E> virtual bool decaf::util::StlList< E >::isEmpty ( )  
const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 1226) == 0.

**Returns**

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 166).

**6.772.3.11** `template<typename E> virtual Iterator<E>* decaf::util::StlList< E  
>::iterator ( ) [inline, virtual]`

**Returns**

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 2221).

**6.772.3.12** `template<typename E> virtual Iterator<E>* decaf::util::StlList< E  
>::iterator ( ) const [inline, virtual]`

Implements **decaf::lang::Iterable< E >** (p. 2222).

**6.772.3.13** `template<typename E> virtual std::size_t decaf::util::StlList<  
E >::lastIndexOf ( const E & value ) throw (  
decaf::lang::exceptions::NoSuchElementException ) [inline,  
virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

**Parameters**

<i>value</i>	- element to search for
--------------	-------------------------

**Returns**

the index of the last occurrence of the specified element in this list.

**Exceptions**

<i>NoSuchElementException</i>	if value is not in the list
-------------------------------	-----------------------------

Implements **decaf::util::List< E >** (p. 2413).

```
6.772.3.14  template<typename E> virtual ListIterator<E>*
             decaf::util::StlList< E >::listIterator ( std::size_t index ) throw (
             decaf::lang::exceptions::IndexOutOfBoundsException ) [inline,
             virtual]
```

**Parameters**

<i>index</i>	index of first element to be returned from the list iterator (by a call to the next method).
--------------	--

**Returns**

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

**Exceptions**

<i>IndexOutOfBoundsException</i>	if the index is out of range (index < 0    index > size() (p. 1226))
----------------------------------	--

Implements **decaf::util::List< E >** (p. 2415).

```
6.772.3.15  template<typename E> virtual ListIterator<E>* decaf::util::StlList< E
             >::listIterator ( ) [inline, virtual]
```

**Returns**

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 2414).

**6.772.3.16** `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator ( ) const [inline, virtual]`

Implements **decaf::util::List< E >** (p. 2414).

**6.772.3.17** `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator ( std::size_t index ) const throw ( decaf::lang::exceptions::IndexOutOfBoundsException ) [inline, virtual]`

Implements **decaf::util::List< E >** (p. 2414).

**6.772.3.18** `template<typename E> virtual E decaf::util::StlList< E >::remove ( std::size_t index ) throw ( decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException ) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

#### Parameters

<i>index</i>	- the index of the element to be removed
--------------	--

#### Returns

the element previously at the specified position

#### Exceptions

<i>IndexOutOfBoundsException</i>	- if the index is greater than size
<i>UnsupportedOperationException</i>	- If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 2415).

**6.772.3.19** `template<typename E> virtual bool decaf::util::StlList< E >::remove ( const E & value ) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException ) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified

element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

#### Parameters

<i>value</i>	- element to be removed from this collection, if present
--------------	--

#### Returns

true if an element was removed as a result of this call

#### Exceptions

<i>UnsupportedOperationException</i>	if the remove operation is not supported by this collection.
<i>IllegalArgumentException</i>	If the value is not a valid entry for this <b>Collection</b> (p. 1216).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 168).

```
6.772.3.20  template<typename E> virtual E decaf::util::StlList<
            E >::set ( std::size_t index, const E & element ) throw (
            decaf::lang::exceptions::IndexOutOfBoundsException ) [inline,
            virtual]
```

Replaces the element at the specified position in this list with the specified element.

#### Parameters

<i>index</i>	- index of the element to replace
<i>element</i>	- element to be stored at the specified position

#### Returns

the element previously at the specified position

#### Exceptions

<i>IndexOutOfBoundsException</i>	- if the index is greater than size
----------------------------------	-------------------------------------

Implements **decaf::util::List< E >** (p. 2416).

**6.772.3.21** `template<typename E> virtual std::size_t decaf::util::StlList< E >::size ( )`  
`const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX\_VALUE elements, returns Integer.MAX\_VALUE.

### Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1226).

Referenced by `decaf::util::StlList< cms::Connection * >::add()`, `decaf::util::StlList< cms::Connection * >::addAll()`, `decaf::util::StlList< cms::Connection * >::get()`, `decaf::util::StlList< cms::Connection * >::lastIndexOf()`, `decaf::util::StlList< cms::Connection * >::listIterator()`, `decaf::util::StlList< cms::Connection * >::remove()`, and `decaf::util::StlList< cms::Connection * >::set()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlList.h`

## 6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference

**Map** (p. 2538) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

```
#include <src/main/decaf/util/StlMap.h>
```

Inheritance diagram for `decaf::util::StlMap< K, V, COMPARATOR >`:

### Public Member Functions

- **StlMap** ()  
*Default constructor - does nothing.*
- **StlMap** (const **StlMap** &source)  
*Copy constructor - copies the content of the given map into this one.*
- **StlMap** (const **Map**< K, V, COMPARATOR > &source)  
*Copy constructor - copies the content of the given map into this one.*
- virtual **~StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const

## 6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 713

- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const

*Comparison, equality is dependent on the method of determining if the element are equal.*

### Parameters

source	- <b>Map</b> (p. 2538) to compare to this one.
--------	--

### Returns

*true if the **Map** (p. 2538) passed is equal in value to this one.*

- virtual void **copy** (const **StlMap** &source)

- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)

*Copies the content of the source map into this map.*

*Erases all existing data in this map.*

### Parameters

source	The source object to copy from.
--------	---------------------------------

- virtual void **clear** () throw ( decaf::lang::exceptions::UnsupportedOperationException )

*Removes all keys and values from this map.*

### Exceptions

UnsupportedOperationException	if this map is unmodifiable.
-------------------------------	------------------------------

- virtual bool **containsKey** (const K &key) const

*Indicates whether or this map contains a value for the given key.*

### Parameters

key	The key to look up.
-----	---------------------

### Returns

*true if this map contains the value, otherwise false.*

- virtual bool **containsValue** (const V &value) const

*Indicates whether or this map contains a value for the given value, i.e.*

*they are equal, this is done by operator== so the types must pass equivalence testing in this manner.*

### Parameters

value	The Value to look up.
-------	-----------------------

### Returns

*true if this map contains the value, otherwise false.*

- virtual bool **isEmpty** () const

**Returns**

if the **Map** (p. 2538) contains any element or not, *TRUE* or *FALSE*

- virtual std::size\_t **size** () const

**Returns**

The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key) throw ( lang::exceptions::NoSuchElementException )

*Gets the value mapped to the specified key in the **Map** (p. 2538).*

*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

**Parameters**

key	The search key.
-----	-----------------

**Returns**

A reference to the value for the given key.

**Exceptions**

NoSuchElementException	if the key requests doesn't exist in the <b>Map</b> (p. 2538).
------------------------	--

- virtual const V & **get** (const K &key) const throw ( lang::exceptions::NoSuchElementException )

*Gets the value mapped to the specified key in the **Map** (p. 2538).*

*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

**Parameters**

key	The search key.
-----	-----------------

**Returns**

A {const} reference to the value for the given key.

**Exceptions**

NoSuchElementException	if the key requests doesn't exist in the <b>Map</b> (p. 2538).
------------------------	--

- virtual void **put** (const K &key, const V &value) throw ( decaf::lang::exceptions::UnsupportedOperationException )

*Sets the value for the specified key.*

**Parameters**

key	The target key.
value	The value to be set.

**Exceptions**

## 6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 1715

UnsupportedOperation Exception	<i>if this map is unmodifiable.</i>
-----------------------------------	-------------------------------------

- virtual void **putAll** (const **StlMap**< K, V, COMPARATOR > &other) throw ( decaf::lang::exceptions::UnsupportedOperationException )

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other) throw ( decaf::lang::exceptions::UnsupportedOperationException )

*Stores a copy of the Mappings contained in the other **Map** (p. 2538) in this one.*

### Parameters

other	A <b>Map</b> (p. 2538) instance whose elements are to all be inserted in this <b>Map</b> (p. 2538).
-------	---

### Exceptions

UnsupportedOperation Exception	<i>If the implementing class does not support the putAll operation.</i>
-----------------------------------	---

- virtual V **remove** (const K &key) throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException )

*Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.*

### Parameters

key	The search key.
-----	-----------------

### Returns

*a copy of the element that was previously mapped to the given key*

### Exceptions

NoSuchElementExcep- tion	<i>if this key is not in the <b>Map</b> (p. 2538).</i>
UnsupportedOperation Exception	<i>if this map is unmodifiable.</i>

- virtual std::vector< K > **keySet** () const

*Returns a **Set** (p. 3538) view of the mappings contained in this map.*

*The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2223), **Set.remove** (p. 168), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

### Returns

*the entire set of keys in this map as a std::vector.*

- virtual std::vector< V > **values** () const

**Returns**

*the entire set of values in this map as a std::vector.*

- virtual void **lock** () throw ( decaf::lang::exceptions::RuntimeException )

*Locks the object.*

- virtual bool **tryLock** () throw ( decaf::lang::exceptions::RuntimeException )

*Attempts to Lock the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** () throw ( decaf::lang::exceptions::RuntimeException )

*Unlocks the object.*

- virtual void **wait** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )

*Waits on a signal from this object, which is generated by a call to Notify.*

- virtual void **wait** (long long millisecs) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )

*Waits on a signal from this object, which is generated by a call to Notify.*

- virtual void **wait** (long long millisecs, int nanos) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )

*Waits on a signal from this object, which is generated by a call to Notify.*

- virtual void **notify** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )

*Signals a waiter on this object that it can now wake up and continue.*

- virtual void **notifyAll** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )

*Signals the waiters on this object that it can now wake up and continue.*

**6.773.1 Detailed Description**

```
template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::StlMap<
K, V, COMPARATOR >
```

**Map** (p. 2538) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

**Since**

1.0

## 6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 17

### 6.773.2 Constructor & Destructor Documentation

6.773.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
decaf::util::StlMap< K, V, COMPARATOR >::StlMap ( ) [inline]`

Default constructor - does nothing.

6.773.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
decaf::util::StlMap< K, V, COMPARATOR >::StlMap ( const StlMap< K, V,  
COMPARATOR > & source ) [inline]`

Copy constructor - copies the content of the given map into this one.

#### Parameters

<i>source</i>	The source map.
---------------	-----------------

6.773.2.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
decaf::util::StlMap< K, V, COMPARATOR >::StlMap ( const Map< K, V,  
COMPARATOR > & source ) [inline]`

Copy constructor - copies the content of the given map into this one.

#### Parameters

<i>source</i>	The source map.
---------------	-----------------

6.773.2.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual decaf::util::StlMap< K, V, COMPARATOR >::~~StlMap ( )  
[inline, virtual]`

### 6.773.3 Member Function Documentation

6.773.3.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual void decaf::util::StlMap< K, V, COMPARATOR >::clear ( ) throw  
( decaf::lang::exceptions::UnsupportedOperationException )  
[inline, virtual]`

Removes all keys and values from this map.

#### Exceptions

<i>UnsupportedOperation Exception</i>	if this map is unmodifiable.
---	------------------------------

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2540).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

```
6.773.3.2  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsKey ( const K &
            key ) const    [inline, virtual]
```

Indicates whether or this map contains a value for the given key.

#### Parameters

<i>key</i>	The key to look up.
------------	---------------------

#### Returns

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2541).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`.

```
6.773.3.3  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsValue ( const V
            & value ) const    [inline, virtual]
```

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

#### Parameters

<i>value</i>	The Value to look up.
--------------	-----------------------

#### Returns

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2542).

```
6.773.3.4  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy ( const StlMap<
            K, V, COMPARATOR > & source )    [inline, virtual]
```

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::StlMap()`.

```
6.773.3.5  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy ( const Map< K,
            V, COMPARATOR > & source )    [inline, virtual]
```

Copies the content of the source map into this map.

### 6.773 `decaf::util::StlMap< K, V, COMPARATOR >` Class Template Reference 19

Erases all existing data in this map.

#### Parameters

<i>source</i>	The source object to copy from.
---------------	---------------------------------

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2543).

**6.773.3.6** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals ( const Map<  
K, V, COMPARATOR > & source ) const [inline, virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

#### Parameters

<i>source</i>	- <b>Map</b> (p. 2538) to compare to this one.
---------------	--

#### Returns

true if the **Map** (p. 2538) passed is equal in value to this one.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2543).

**6.773.3.7** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals ( const  
StlMap< K, V, COMPARATOR > & source ) const [inline, virtual]`

**6.773.3.8** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual V& decaf::util::StlMap< K, V, COMPARATOR >::get ( const K & key )  
throw ( lang::exceptions::NoSuchElementException ) [inline,  
virtual]`

Gets the value mapped to the specified key in the **Map** (p. 2538).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

#### Parameters

<i>key</i>	The search key.
------------	-----------------

#### Returns

A reference to the value for the given key.

#### Exceptions

<i>NoSuchElementException</i>	if the key requests doesn't exist in the <b>Map</b> (p. 2538).
-------------------------------	--

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 2543).

```
6.773.3.9  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual const V& decaf::util::StlMap< K, V, COMPARATOR >::get ( const K & key
            ) const throw ( lang::exceptions::NoSuchElementException )  [inline,
            virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 2538).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** is thrown.

#### Parameters

<i>key</i>	The search key.
------------	-----------------

#### Returns

A {const} reference to the value for the given key.

#### Exceptions

<i>NoSuchElementException</i>	if the key requests doesn't exist in the <b>Map</b> (p. 2538).
-------------------------------	--

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 2544).

```
6.773.3.10  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::StlMap< K, V, COMPARATOR >::isEmpty ( ) const
            [inline, virtual]
```

#### Returns

if the **Map** (p. 2538) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 2545).

```
6.773.3.11  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<K> decaf::util::StlMap< K, V, COMPARATOR >::keySet ( )
            const  [inline, virtual]
```

Returns a **Set** (p. 3538) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2223), **Set.remove** (p. 168), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

## 6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 3721

### Returns

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2546).

**6.773.3.12** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual void decaf::util::StlMap< K, V, COMPARATOR >::lock ( ) throw (  
decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3812).

**6.773.3.13** `template<typename K, typename V, typename COMPARATOR =  
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR  
>::notify ( ) throw ( decaf::lang::exceptions::RuntimeException,  
decaf::lang::exceptions::IllegalMonitorStateException) [inline,  
virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3813).

**6.773.3.14** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual void decaf::util::StlMap< K, V, COMPARATOR >::notifyAll  
( ) throw ( decaf::lang::exceptions::RuntimeException,  
decaf::lang::exceptions::IllegalMonitorStateException) [inline,  
virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
-------------------------------------	--

<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.
-------------------------	---

Implements **decaf::util::concurrent::Synchronizable** (p. 3814).

```
6.773.3.15  template<typename K, typename V, typename COMPARTOR
= std::less<K>> virtual void decaf::util::StlMap< K, V,
COMPARTOR >::put ( const K & key, const V & value ) throw (
decaf::lang::exceptions::UnsupportedOperationException )
[inline, virtual]
```

Sets the value for the specified key.

#### Parameters

<i>key</i>	The target key.
<i>value</i>	The value to be set.

#### Exceptions

<i>UnsupportedOperationException</i>	if this map is unmodifiable.
--------------------------------------	------------------------------

Implements **decaf::util::Map< K, V, COMPARTOR >** (p. 2547).

Referenced by **decaf::util::StlMap< std::string, cms::Topic \* >::putAll()**.

```
6.773.3.16  template<typename K, typename V, typename COMPARTOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARTOR
>::putAll ( const StlMap< K, V, COMPARTOR > & other ) throw (
decaf::lang::exceptions::UnsupportedOperationException )
[inline, virtual]
```

Referenced by **decaf::util::StlMap< std::string, cms::Topic \* >::copy()**.

```
6.773.3.17  template<typename K, typename V, typename COMPARTOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARTOR
>::putAll ( const Map< K, V, COMPARTOR > & other ) throw (
decaf::lang::exceptions::UnsupportedOperationException )
[inline, virtual]
```

Stores a copy of the Mappings contained in the other **Map** (p. 2538) in this one.

#### Parameters

<i>other</i>	A <b>Map</b> (p. 2538) instance whose elements are to all be inserted in this <b>Map</b> (p. 2538).
--------------	---

## 6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 723

### Exceptions

<i>UnsupportedOperationException</i>	If the implementing class does not support the putAll operation.
--------------------------------------	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2548).

**6.773.3.18** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove ( const K &  
key ) throw ( decaf::lang::exceptions::NoSuchElementException,  
decaf::lang::exceptions::UnsupportedOperationException )  
[inline, virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

### Parameters

<i>key</i>	The search key.
------------	-----------------

### Returns

a copy of the element that was previously mapped to the given key

### Exceptions

<i>NoSuchElementException</i>	if this key is not in the <b>Map</b> (p. 2538).
<i>UnsupportedOperationException</i>	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2548).

**6.773.3.19** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual std::size_t decaf::util::StlMap< K, V, COMPARATOR >::size ( ) const  
[inline, virtual]`

### Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2549).

**6.773.3.20** `template<typename K, typename V, typename COMPARATOR = std::less<K>>  
virtual bool decaf::util::StlMap< K, V, COMPARATOR >::tryLock ( ) throw (   
decaf::lang::exceptions::RuntimeException ) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

**Returns**

true if the lock was acquired, false if it is already held by another thread.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3815).

```
6.773.3.21  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::unlock ( ) throw (
            decaf::lang::exceptions::RuntimeException ) [inline, virtual]
```

Unlocks the object.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3816).

```
6.773.3.22  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<V> decaf::util::StlMap< K, V, COMPARATOR >::values ( )
            const [inline, virtual]
```

**Returns**

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2550).

Referenced by decaf::util::StlMap< std::string, cms::Topic \* >::values().

```
6.773.3.23  template<typename K, typename V, typename COMPARATOR =
            std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
            >::wait ( ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException,
            decaf::lang::exceptions::InterruptedException ) [inline,
            virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

## 6.773 `decaf::util::StlMap< K, V, COMPARATOR >` Class Template Reference 3725

Implements `decaf::util::concurrent::Synchronizable` (p. 3818).

```
6.773.3.24  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait ( long long
millisecs, int nanos ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException ) [inline,
virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

### Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

### Exceptions

<i>IllegalArgumentException</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3820).

```
6.773.3.25  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait ( long
long millisecs ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException ) [inline,
virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

**Parameters**

<i>milliseconds</i>	the time in milliseconds to wait, or WAIT_INFINITE
---------------------	--

**Exceptions**

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3819).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlMap.h`

**6.774 decaf::util::StlQueue< T > Class Template Reference**

The **Queue** (p. 3239) class accepts messages with an `psuh(m)` command where `m` is the message to be queued.

```
#include <src/main/decaf/util/StlQueue.h>
```

Inheritance diagram for `decaf::util::StlQueue< T >`:

*Signals a waiter on this object that it can now wake up and continue.*

- virtual void **notifyAll** () throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )

*Signals the waiters on this object that it can now wake up and continue.*

- T & **getSafeValue** ()

*Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.*

### 6.774.1 Detailed Description

```
template<typename T> class decaf::util::StlQueue< T >
```

The **Queue** (p. 3239) class accepts messages with an `push(m)` command where `m` is the message to be queued. It destructively returns the message with `pop()` (p. 3728). `pop()` (p. 3728) returns messages in the order they were enqueued.

**Queue** (p. 3239) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the `pop` method actually reaturns a reference to the element popped. This frees the app from having to call the `front` method before calling `pop`.

```
Queue<string> sq; // make a queue to hold string messages
sq.push(s); // enqueues a message m
string s = sq.pop(); // dequeues a message
```

#### = DESIGN CONSIDERATIONS

The **Queue** (p. 3239) class inherits from the `Synchronizable` interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 3239).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

## 6.774.2 Constructor & Destructor Documentation

6.774.2.1 `template<typename T> decaf::util::StdQueue< T >::StdQueue ( )`  
[inline]

6.774.2.2 `template<typename T> virtual decaf::util::StdQueue< T >::~~StdQueue ( )`  
[inline, virtual]

## 6.774.3 Member Function Documentation

6.774.3.1 `template<typename T> T& decaf::util::StdQueue< T >::back ( )`  
[inline]

Returns a Reference to the element at the tail of the queue.

### Returns

reference to a queue type object or (safe)

6.774.3.2 `template<typename T> const T& decaf::util::StdQueue< T >::back ( ) const`  
[inline]

Returns a Reference to the element at the tail of the queue.

### Returns

reference to a queue type object or (safe)

6.774.3.3 `template<typename T> void decaf::util::StdQueue< T >::clear ( )`  
[inline]

Empties this queue.

6.774.3.4 `template<typename T> bool decaf::util::StdQueue< T >::empty ( ) const`  
[inline]

Checks if this **Queue** (p. 3239) is currently empty.

### Returns

boolean indicating queue emptiness

6.774.3.5 `template<typename T> void decaf::util::StdQueue< T >::enqueueFront ( const T & t )` [inline]

Places a new Object at the front of the queue.

**Parameters**

<i>t</i>	- <b>Queue</b> (p. 3239) Object Type reference.
----------	---

**6.774.3.6** `template<typename T> const T& decaf::util::StlQueue< T >::front ( ) const`  
`[inline]`

Returns a Reference to the element at the head of the queue.

**Returns**

reference to a queue type object or (safe)

**6.774.3.7** `template<typename T> T& decaf::util::StlQueue< T >::front ( )`  
`[inline]`

Returns a Reference to the element at the head of the queue.

**Returns**

reference to a queue type object or (safe)

**6.774.3.8** `template<typename T> T& decaf::util::StlQueue< T >::getSafeValue ( )`  
`[inline]`

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

**Returns**

Reference to this Queues safe object

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::back()`, `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::front()`, and `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::pop()`.

**6.774.3.9** `template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator ( )`  
`[inline]`

Gets an **Iterator** (p. 2222) over this **Queue** (p. 3239).

**Returns**

new iterator pointer that is owned by the caller.

```
6.774.3.10  template<typename T> virtual void decaf::util::StlQueue< T >::lock ( )
            throw ( decaf::lang::exceptions::RuntimeException ) [inline,
            virtual]
```

Locks the object.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3812).

```
6.774.3.11  template<typename T> virtual void decaf::util::StlQueue< T
            >::notify ( ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException ) [inline,
            virtual]
```

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

#### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3813).

```
6.774.3.12  template<typename T> virtual void decaf::util::StlQueue< T
            >::notifyAll ( ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException ) [inline,
            virtual]
```

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

#### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3814).

**6.774.3.13** `template<typename T> T decaf::util::StlQueue< T >::pop ( ) [inline]`

Removes and returns the element that is at the Head of the queue.

#### Returns

reference to a queue type object or (safe)

**6.774.3.14** `template<typename T> void decaf::util::StlQueue< T >::push ( const T & t ) [inline]`

Places a new Object at the Tail of the queue.

#### Parameters

<i>t</i>	- <b>Queue</b> (p. 3239) Object Type reference.
----------	---

**6.774.3.15** `template<typename T> void decaf::util::StlQueue< T >::reverse ( StlQueue< T > & target ) const [inline]`

Reverses the order of the contents of this queue and stores them in the target queue.

#### Parameters

<i>target</i>	- The target queue that will receive the contents of this queue in reverse order.
---------------	---

**6.774.3.16** `template<typename T> size_t decaf::util::StlQueue< T >::size ( ) const [inline]`

Gets the Number of elements currently in the **Queue** (p. 3239).

#### Returns

**Queue** (p. 3239) Size

**6.774.3.17** `template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray ( ) const [inline, virtual]`

#### Returns

the all values in this queue as a std::vector.

**6.774.3.18** `template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock (`  
`) throw ( decaf::lang::exceptions::RuntimeException ) [inline,`  
`virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

#### Returns

true if the lock was acquired, false if it is already held by another thread.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3815).

**6.774.3.19** `template<typename T> virtual void decaf::util::StlQueue< T >::unlock (`  
`) throw ( decaf::lang::exceptions::RuntimeException ) [inline,`  
`virtual]`

Unlocks the object.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3816).

**6.774.3.20** `template<typename T> virtual void decaf::util::StlQueue< T`  
`>::wait ( ) throw ( decaf::lang::exceptions::RuntimeException,`  
`decaf::lang::exceptions::IllegalMonitorStateException,`  
`decaf::lang::exceptions::InterruptedException ) [inline,`  
`virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3818).

**6.774.3.21** `template<typename T> virtual void decaf::util::StlQueue< T >::wait ( long long millisecs ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

#### Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

#### Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3819).

**6.774.3.22** `template<typename T> virtual void decaf::util::StlQueue< T >::wait ( long long millisecs, int nanos ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

#### Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

#### Exceptions

<i>IllegalArgumentException</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
---------------------------------	--

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3820).

The documentation for this class was generated from the following file:

- src/main/decaf/util/StlQueue.h

## 6.775 decaf::util::StlSet< E > Class Template Reference

**Set** (p. 3538) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

```
#include <src/main/decaf/util/StlSet.h>
```

Inheritance diagram for decaf::util::StlSet< E >:

### Data Structures

- class **ConstSetIterator**
- class **SetIterator**

### Public Member Functions

- **StlSet** ()  
*Default constructor - does nothing.*
- **StlSet** (const **StlSet** &source)  
*Copy constructor - copies the content of the given set into this one.*
- **StlSet** (const **Collection**< E > &source)  
*Copy constructor - copies the content of the given set into this one.*
- virtual **~StlSet** ()
- **Iterator**< E > \* **iterator** ()  
*Returns*  
*an iterator over a set of elements of type T.*
- **Iterator**< E > \* **iterator** () const
- virtual bool **equals** (const **StlSet** &source) const

- virtual void **copy** (const **StdSet** &source)
- virtual void **clear** () throw ( lang::exceptions::UnsupportedOperationException )

*Removes all of the elements from this collection (optional operation).*

*The collection will be empty after this method returns.*

*This implementation iterates over this collection, removing each element using the **Iterator.remove** (p.2223) operation. Most implementations will probably choose to override this method for efficiency.*

*Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

#### **Exceptions**

UnsupportedOperationException	if the clear operation is not supported by this collection
-------------------------------	--

- virtual bool **contains** (const E &value) const throw ( lang::Exception )

*Returns true if this collection contains the specified element.*

*This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.*

#### **Parameters**

value	- the value whose presence is to be queried for in this <b>Collection</b> (p.1216).
-------	---

#### **Returns**

*true if the value is contained in this collection*

#### **Exceptions**

Exception	if an error occurs,
-----------	---------------------

- virtual bool **isEmpty** () const
- virtual std::size\_t **size** () const
- virtual bool **add** (const E &value) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException )

*Returns true if this collection changed as a result of the call.*

*(Returns false if this collection does not permit duplicates and already contains the specified element.)*

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p.1216) classes should clearly specify in their documentation any restrictions on what elements may be added.*

*If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.*

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

**Parameters**

value	- reference to the element to add.
-------	------------------------------------

**Returns**

*true if the element was added*

**Exceptions**

UnsupportedOperationException	
IllegalArgumentException	
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions</i>

- virtual bool **remove** (const E &value) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException )

*Removes a single instance of the specified element from this collection, if it is present (optional operation).*

*More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).*

*This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.*

*Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.*

**Parameters**

value	- element to be removed from this collection, if present
-------	--

**Returns**

*true if an element was removed as a result of this call*

**Exceptions**

UnsupportedOperationException	<i>if the remove operation is not supported by this collection.</i>
IllegalArgumentException	<i>If the value is not a valid entry for this <b>Collection</b> (p. 1216).</i>

**6.775.1 Detailed Description**

template<typename E> class decaf::util::StlSet< E >

**Set** (p. 3538) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

## 6.775.2 Constructor & Destructor Documentation

6.775.2.1 `template<typename E> decaf::util::StlSet< E >::StlSet ( ) [inline]`

Default constructor - does nothing.

6.775.2.2 `template<typename E> decaf::util::StlSet< E >::StlSet ( const StlSet< E > & source ) [inline]`

Copy constructor - copies the content of the given set into this one.

### Parameters

<i>source</i>	The source set.
---------------	-----------------

6.775.2.3 `template<typename E> decaf::util::StlSet< E >::StlSet ( const Collection< E > & source ) [inline]`

Copy constructor - copies the content of the given set into this one.

### Parameters

<i>source</i>	The source set.
---------------	-----------------

6.775.2.4 `template<typename E> virtual decaf::util::StlSet< E >::~~StlSet ( ) [inline, virtual]`

## 6.775.3 Member Function Documentation

6.775.3.1 `template<typename E> virtual bool decaf::util::StlSet< E >::add ( const E & value ) throw ( lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException ) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1216) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after

this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

#### Parameters

<i>value</i>	- reference to the element to add.
--------------	------------------------------------

#### Returns

true if the element was added

#### Exceptions

<i>UnsupportedOperationException</i>	
<i>IllegalArgumentException</i>	
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 1218).

**6.775.3.2** `template<typename E> virtual void decaf::util::StdSet< E >::clear ( ) throw ( lang::exceptions::UnsupportedOperationException ) [inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 2223) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

#### Exceptions

<i>UnsupportedOperationException</i>	if the clear operation is not supported by this collection
--------------------------------------	--

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 163).

**6.775.3.3** `template<typename E> virtual bool decaf::util::StlSet< E >::contains ( const E & value ) const throw ( lang::Exception ) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

#### Parameters

<i>value</i>	- the value whose presence is to be queried for in this <b>Collection</b> (p. 1216).
--------------	--

#### Returns

true if the value is contained in this collection

#### Exceptions

<i>Exception</i>	if an error occurs,
------------------	---------------------

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 164).

**6.775.3.4** `template<typename E> virtual void decaf::util::StlSet< E >::copy ( const StlSet< E > & source ) [inline, virtual]`

Referenced by `decaf::util::StlSet< ActiveMQSession * >::StlSet()`.

**6.775.3.5** `template<typename E> virtual bool decaf::util::StlSet< E >::equals ( const StlSet< E > & source ) const [inline, virtual]`

**6.775.3.6** `template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty ( ) const [inline, virtual]`

#### Returns

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 166).

**6.775.3.7** `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator ( ) const [inline, virtual]`

Implements **decaf::lang::Iterable< E >** (p. 2222).

**6.775.3.8** `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator ( ) [inline, virtual]`

#### Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 2221).

**6.775.3.9** `template<typename E> virtual bool decaf::util::StlSet< E >::remove ( const E  
& value ) throw ( lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException ) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

#### Parameters

<i>value</i>	- element to be removed from this collection, if present
--------------	--

#### Returns

true if an element was removed as a result of this call

#### Exceptions

<i>UnsupportedOperationException</i>	if the remove operation is not supported by this collection.
<i>IllegalArgumentException</i>	If the value is not a valid entry for this <b>Collection</b> (p. 1216).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 168).

**6.775.3.10** `template<typename E> virtual std::size_t decaf::util::StlSet< E >::size ( )  
const [inline, virtual]`

#### Returns

The number of elements in this set.

Implements **decaf::util::Collection< E >** (p. 1226).

### 6.777.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

### 6.777.2 Constructor & Destructor Documentation

#### 6.777.2.1 **activemq::wireformat::stomp::StompFrame::StompFrame ( )** [inline]

Default constructor.

#### 6.777.2.2 **virtual activemq::wireformat::stomp::StompFrame::~~StompFrame ( )** [inline, virtual]

Destruction.

### 6.777.3 Member Function Documentation

#### 6.777.3.1 **StompFrame\*** **activemq::wireformat::stomp::StompFrame::clone ( )** const

Clone this message exactly, returns a new instance that the caller is required to delete.

**Returns**

new copy of this message

**6.777.3.2 void activemq::wireformat::stomp::StompFrame::copy ( const StompFrame \* *src* )**

Copies the contents of the passed Frame to this one.

**Parameters**

<i>src</i>	- Frame to copy
------------	-----------------

**6.777.3.3 void activemq::wireformat::stomp::StompFrame::fromStream ( decaf::io::DataInputStream \* *stream* ) throw ( decaf::io::IOException )**

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

**Parameters**

<i>stream</i>	- The stream to read the Frame from.
---------------	--------------------------------------

**Exceptions**

<i>IOException</i>	if an error occurs while writing the Frame.
--------------------	---

**6.777.3.4 const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody ( ) const [inline]**

Accessor for the body data of this frame.

**Returns**

char pointer to body data

**6.777.3.5 std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody ( ) [inline]**

Non-const version of the body accessor.

**6.777.3.6 std::size\_t activemq::wireformat::stomp::StompFrame::getBodyLength ( ) const [inline]**

Return the number of bytes contained in this frames body.

**Returns**

Body bytes length.

**6.777.3.7** `const std::string& activemq::wireformat::stomp::StompFrame::getCommand ( )`  
`const [inline]`

Accessor for this frame's command field.

**6.777.3.8** `decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties ( )` `[inline]`

Gets access to the header properties for this frame.

**Returns**

the Properties object owned by this Frame

**6.777.3.9** `const decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties ( )`  
`const [inline]`

**6.777.3.10** `std::string activemq::wireformat::stomp::StompFrame::getProperty ( const std::string & name, const std::string & fallback = " " ) const` `[inline]`

Gets a property from this Frame's properties and returns it, or the default value given.

**Parameters**

<i>name</i>	- The name of the property to lookup
<i>fallback</i>	- The default value to return if this value isn't set

**Returns**

string value of the property asked for.

**6.777.3.11** `bool activemq::wireformat::stomp::StompFrame::hasProperty ( const std::string & name ) const` `[inline]`

Checks if the given property is present in the Frame.

**Parameters**

<i>name</i>	- The name of the property to check for.
-------------	--

**6.777.3.12** `std::string activemq::wireformat::stomp::StompFrame::removeProperty ( const std::string & name ) [inline]`

Gets and remove the property specified, if the property is not set, this method returns the empty string.

#### Parameters

<i>name</i>	- the Name of the property to get and return.
-------------	---

**6.777.3.13** `void activemq::wireformat::stomp::StompFrame::setBody ( const unsigned char * bytes, std::size_t numBytes )`

Sets the body data of this frame as a byte sequence.

#### Parameters

<i>bytes</i>	The byte buffer to be set in the body.
<i>numBytes</i>	The number of bytes in the buffer.

**6.777.3.14** `void activemq::wireformat::stomp::StompFrame::setCommand ( const std::string & cmd ) [inline]`

Sets the command for this stomp frame.

#### Parameters

<i>cmd</i>	command The command to be set.
------------	--------------------------------

**6.777.3.15** `void activemq::wireformat::stomp::StompFrame::setProperty ( const std::string & name, const std::string & value ) [inline]`

Sets the property given to the value specified in this Frame's Properties.

#### Parameters

<i>name</i>	- Name of the property.
<i>value</i>	- Value to set the property to.

**6.777.3.16** `void activemq::wireformat::stomp::StompFrame::toStream ( decaf::io::DataOutputStream * stream ) const throw ( decaf::io::IOException )`

Writes this Frame to an OuputStream in the Stomp Wire Format.

**Parameters**

<i>stream</i>	- The stream to write the Frame to.
---------------	-------------------------------------

**Exceptions**

<i>IOException</i>	if an error occurs while reading the Frame.
--------------------	---

The documentation for this class was generated from the following file:

### 6.778.1 Detailed Description

Utility Methods used when marshaling to and from StompFrame's.

Since

3.0

### 6.778.2 Constructor & Destructor Documentation

6.778.2.1 **activemq::wireformat::stomp::StompHelper::StompHelper** ( ) `[inline]`

6.778.2.2 **virtual activemq::wireformat::stomp::StompHelper::~~StompHelper** ( )  
`[inline, virtual]`

### 6.778.3 Member Function Documentation

6.778.3.1 **std::string activemq::wireformat::stomp::StompHelper::convertConsumerId** ( const **Pointer< ConsumerId >** & *consumerId* )

Converts a ConsumerId instance to a Stomp ConsumerId String.

#### Parameters

<i>consumerId</i>	- the Consumer instance to convert.
-------------------	-------------------------------------

**Returns**

a Stomp Consumer Id String.

**6.778.3.2 `Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId ( const std::string & consumerId )`**

Converts a Stomp ConsumerId string to a ConsumerId.

**Parameters**

<i>consumerId</i>	- the String Consumer Id to convert.
-------------------	--------------------------------------

**Returns**

Pointer to a new ConsumerId.

**6.778.3.3 `std::string activemq::wireformat::stomp::StompHelper::convertDestination ( const Pointer<ActiveMQDestination> & destination )`**

Converts from a ActiveMQDestination to a Stomp Destination Name.

**Parameters**

<i>destination</i>	- The ActiveMQDestination to Convert
--------------------	--------------------------------------

**Returns**

the Stomp String name that defines the destination.

**6.778.3.4 `Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination ( const std::string & destination )`**

Converts from a Stomp Destination to an ActiveMQDestination.

**Parameters**

<i>destination</i>	- The Stomp Destination name string.
--------------------	--------------------------------------

**Returns**

Pointer to a new ActiveMQDestination.

**6.778.3.5 `std::string activemq::wireformat::stomp::StompHelper::convertMessageId ( const Pointer<MessageId> & messageId )`**

Converts a MessageId instance to a Stomp MessageId String.

**Parameters**

<i>messageId</i>	- the MessageId instance to convert.
------------------	--------------------------------------

**Returns**

a Stomp Message Id String.

**6.778.3.6** `Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId ( const std::string & messageId )`

Converts a Stomp MessageId string to a MessageId.

**Parameters**

<i>messageId</i>	- the String message Id to convert.
------------------	-------------------------------------

**Returns**

Pointer to a new MessageId.

**6.778.3.7** `std::string activemq::wireformat::stomp::StompHelper::convertProducerId ( const Pointer< ProducerId > & producerId )`

Converts a ProducerId instance to a Stomp ProducerId String.

**Parameters**

<i>producerId</i>	- the Producer instance to convert.
-------------------	-------------------------------------

**Returns**

a Stomp Producer Id String.

**6.778.3.8** `Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId ( const std::string & producerId )`

Converts a Stomp ProducerId string to a ProducerId.

**Parameters**

<i>producerId</i>	- the String Producer Id to convert.
-------------------	--------------------------------------

**Returns**

Pointer to a new ProducerId.

**6.778.3.9** `void activemq::wireformat::stomp::StompHelper::convertProperties ( const  
Pointer< Message > & message, const Pointer< StompFrame > & frame )`

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 3741).

#### Parameters

<i>message</i>	- The message to move the Headers to.
<i>frame</i>	- The frame to extract headers from.

**6.778.3.10** `void activemq::wireformat::stomp::StompHelper::convertProperties ( const  
Pointer< StompFrame > & frame, const Pointer< Message > & message )`

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

#### Parameters

<i>frame</i>	- The frame to extract headers from.
<i>message</i>	- The message to move the Headers to.

**6.778.3.11** `Pointer<TransactionId> ac-  
tivemq::wireformat::stomp::StompHelper::convertTransactionId (   
const std::string & transactionId )`

Converts a Stomp TransactionId string to a TransactionId.

#### Parameters

<i>transac- tionId</i>	- the String Transaction Id to convert.
----------------------------	---

#### Returns

Pointer to a new TransactionId.

**6.778.3.12** `std::string activemq::wireformat::stomp::StompHelper::convertTransactionId ( const  
Pointer< TransactionId > & transactionId )`

Converts a TransactionId instance to a Stomp TransactionId String.

#### Parameters

<i>transac- tionId</i>	- the Transaction instance to convert.
----------------------------	--

**Returns**

a Stomp Transaction Id String.

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport) throw ( decaf::lang::exceptions::UnsupportedOperationException )

*If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.*

## 6.779.1 Constructor & Destructor Documentation

6.779.1.1 **activemq::wireformat::stomp::StompWireFormat::StompWireFormat** ( )

6.779.1.2 virtual **activemq::wireformat::stomp::StompWireFormat::~~StompWireFormat** ( )  
[virtual]

## 6.779.2 Member Function Documentation

6.779.2.1 virtual **Pointer**<transport::Transport>  
**activemq::wireformat::stomp::StompWireFormat::createNegotiator** (  
const **Pointer**< **transport::Transport** > & *transport* ) throw (  
decaf::lang::exceptions::UnsupportedOperationException )  
[virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

### Returns

new instance of a **WireFormatNegotiator** (p. 4129).

### Exceptions

<i>UnsupportedOperation Exception</i>	if the <b>WireFormat</b> (p. 4088) doesn't have a Negotiator.
---	---

Implements **activemq::wireformat::WireFormat** (p. 4089).

6.779.2.2 virtual int **activemq::wireformat::stomp::StompWireFormat::getVersion** ( ) const  
[inline, virtual]

Get the Version.

### Returns

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 4090).

**6.779.2.3** `virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator ( ) const`  
`[inline, virtual]`

Returns true if this **WireFormat** (p. 4088) has a Negotiator that needs to wrap the Transport that uses it.

#### Returns

true if the **WireFormat** (p. 4088) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 4090).

**6.779.2.4** `virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive ( ) const`  
`[inline, virtual]`

Is there a Message being unmarshaled?

#### Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 4090).

**6.779.2.5** `virtual void activemq::wireformat::stomp::StompWireFormat::marshal`  
`( const Pointer< commands::Command > & command,`  
`const activemq::transport::Transport * transport,`  
`decaf::io::DataOutputStream * out ) throw ( decaf::io::IOException )`  
`[virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

#### Parameters

<i>command</i>	The Command to Marshal to the output stream.
<i>transport</i>	The Transport that initiated this marshal call.
<i>out</i>	The output stream to write the command to.

#### Exceptions

<i>IOException</i>	
--------------------	--

Implements **activemq::wireformat::WireFormat** (p. 4091).

**6.779.2.6** `virtual void activemq::wireformat::stomp::StompWireFormat::setVersion ( int version`  
`AMQCPP_UNUSED ) [inline, virtual]`

Set the Version.

**Parameters**

<i>the</i>	version of the wire format
------------	----------------------------

Implements **activemq::wireformat::WireFormat** (p. 4091).

**6.779.2.7** `virtual Pointer<commands::Command>`  
`activemq::wireformat::stomp::StompWireFormat::unmarshal ( const`  
`activemq::transport::Transport * transport, decaf::io::DataInputStream`  
`* in ) throw ( decaf::io::IOException ) [virtual]`

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

**Parameters**

<i>transport</i>	- Pointer to the transport that is making this request.
<i>in</i>	- the input stream to read the command from.

**Returns**

the newly marshaled Command, caller owns the pointer

**Exceptions**

<i>IOException</i>
--------------------

Implements **activemq::wireformat::WireFormat** (p. 4091).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompWireFormat.h`

## 6.780 **activemq::wireformat::stomp::StompWireFormatFactory Class Reference**

Factory used to create the Stomp Wire Format instance.

```
#include <src/main/activemq/wireformat/stomp/StompWireFormatFactory.h>
```

Inheritance diagram for `activemq::wireformat::stomp::StompWireFormatFactory`:

**Public Member Functions**

- `StompWireFormatFactory ()`

- virtual `~StompWireFormatFactory()`
- virtual `Pointer<WireFormat> createWireFormat(const decaf::util::Properties &properties) throw ( decaf::lang::exceptions::IllegalStateException )`

*Creates a new **WireFormat** (p. 4088) Object passing it a set of properties from which it can obtain any optional settings.*

### 6.780.1 Detailed Description

Factory used to create the Stomp Wire Format instance.

### 6.780.2 Constructor & Destructor Documentation

**6.780.2.1** `activemq::wireformat::stomp::StompWireFormatFactory::StompWireFormatFactory()` `[inline]`

**6.780.2.2** `virtual activemq::wireformat::stomp::StompWireFormatFactory::~~StompWireFormatFactory()` `[inline, virtual]`

### 6.780.3 Member Function Documentation

**6.780.3.1** `virtual Pointer<WireFormat> activemq::wireformat::stomp::StompWireFormatFactory::createWireFormat(const decaf::util::Properties & properties) throw ( decaf::lang::exceptions::IllegalStateException )` `[virtual]`

Creates a new **WireFormat** (p. 4088) Object passing it a set of properties from which it can obtain any optional settings.

#### Parameters

<i>properties</i>	- the Properties for this <b>WireFormat</b> (p. 4088)
-------------------	---

Implements `activemq::wireformat::WireFormatFactory` (p. 4093).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompWireFormatFactory.h`

## 6.781 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

```
#include <src/main/cms/Stoppable.h>
```

Inheritance diagram for cms::Stoppable:

## Public Member Functions

- virtual `~Stoppable()`
- virtual void `stop()`=0 throw ( `CMSEException` )

*Stops this service.*

### 6.781.1 Detailed Description

Interface for a class that implements the stop method. An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

#### Since

1.0

### 6.781.2 Constructor & Destructor Documentation

6.781.2.1 virtual `cms::Stoppable::~~Stoppable()` [`inline`, `virtual`]

### 6.781.3 Member Function Documentation

6.781.3.1 virtual void `cms::Stoppable::stop()` throw ( `CMSEException` ) [`pure virtual`]

Stops this service.

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- if an internal error occurs while stopping the Service.
--	---

Implemented in `activemq::core::ActiveMQConnection` (p. 280).

The documentation for this class was generated from the following file:

- `src/main/cms/Stoppable.h`

## 6.782 decaf::util::logging::StreamHandler Class Reference

Stream based logging **Handler** (p. 2042).

```
#include <src/main/decaf/util/logging/StreamHandler.h>
```

Inheritance diagram for decaf::util::logging::StreamHandler:

## Public Member Functions

- **StreamHandler** ()  
*Create a **StreamHandler** (p. 3756), with no current output stream.*
- **StreamHandler** (decaf::io::OutputStream \*stream, Formatter \*formatter)  
*Create a **StreamHandler** (p. 3756), with no current output stream.*
- virtual ~**StreamHandler** ()
- virtual void **close** () throw ( decaf::io::IOException )  
*Close the current output stream.*
- virtual void **flush** ()  
*Flush the Handler's output, clears any buffers.*
- virtual void **publish** (const **LogRecord** &record)  
*Publish the Log Record to this **Handler** (p. 2042).*
- virtual bool **isLoggable** (const **LogRecord** &record) const  
*Check if this **Handler** (p. 2042) would actually log a given **LogRecord** (p. 2487).*

## Protected Member Functions

- virtual void **setOutputStream** (decaf::io::OutputStream \*stream) throw ( decaf::lang::exceptions::NullPointerException )  
*Change the output stream.*
- void **close** (bool closeStream)  
*Closes this handler, but the underlying output stream is only closed if closeStream is true.*

### 6.782.1 Detailed Description

Stream based logging **Handler** (p. 2042). This is primarily intended as a base class or support class to be used in implementing other logging Handlers.

LogRecords are published to a given **decaf::io::OutputStream** (p. 2991).

Configuration: By default each **StreamHandler** (p. 3756) is initialized using the following **LogManager** (p. 2480) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

\* `decaf.util.logging.StreamHandler.level` specifies the default level for the **Handler** (p. 2042) (defaults to **Level.INFO** (p. 2408)). \* `decaf.util.logging.StreamHandler.filter` specifies the name of a **Filter** (p. 1949) class to use (defaults to no **Filter** (p. 1949)). \* `decaf.util.logging.StreamHandler.formatter` specifies the name of a **Formatter** (p. 2027) class to use (defaults to **decaf.util.logging.SimpleFormatter** (p. 3604)).

### Since

1.0

## 6.782.2 Constructor & Destructor Documentation

### 6.782.2.1 `decaf::util::logging::StreamHandler::StreamHandler ( )`

Create a **StreamHandler** (p. 3756), with no current output stream.

### 6.782.2.2 `decaf::util::logging::StreamHandler::StreamHandler ( decaf::io::OutputStream * stream, Formatter * formatter )`

Create a **StreamHandler** (p. 3756), with no current output stream.

### 6.782.2.3 `virtual decaf::util::logging::StreamHandler::~StreamHandler ( )` [virtual]

## 6.782.3 Member Function Documentation

### 6.782.3.1 `virtual void decaf::util::logging::StreamHandler::close ( ) throw ( decaf::io::IOException )` [virtual]

Close the current output stream.

The close method will perform a flush and then close the **Handler** (p. 2042). After close has been called this **Handler** (p. 2042) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

### Exceptions

<i>IOException</i> if an I/O error occurs.
--

Implements **decaf::io::Closeable** (p. 1181).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 1440).

### 6.782.3.2 `void decaf::util::logging::StreamHandler::close ( bool closeStream )` [protected]

Closes this handler, but the underlying output stream is only closed if `closeStream` is true.

**Parameters**

<i>closeStream</i>	whether to close the underlying output stream.
--------------------	--

**6.782.3.3** virtual void decaf::util::logging::StreamHandler::flush ( ) [virtual]

Flush the Handler's output, clears any buffers.

Implements **decaf::util::logging::Handler** (p. 2043).

**6.782.3.4** virtual bool decaf::util::logging::StreamHandler::isLoggable ( const **LogRecord** & *record* ) const [virtual]

Check if this **Handler** (p. 2042) would actually log a given **LogRecord** (p. 2487).

**Parameters**

<i>record</i>	<b>LogRecord</b> (p. 2487) to check
---------------	-------------------------------------

**Returns**

true if the record can be logged with current settings.

Reimplemented from **decaf::util::logging::Handler** (p. 2044).

**6.782.3.5** virtual void decaf::util::logging::StreamHandler::publish ( const **LogRecord** & *record* ) [virtual]

Publish the Log Record to this **Handler** (p. 2042).

**Parameters**

<i>record</i>	The <b>LogRecord</b> (p. 2487) to Publish
---------------	---

Implements **decaf::util::logging::Handler** (p. 2044).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 1441).

**6.782.3.6** virtual void decaf::util::logging::StreamHandler::setOutputStream ( decaf::io::OutputStream \* *stream* ) throw ( decaf::lang::exceptions::NullPointerException ) [protected, virtual]

Change the output stream.

If there is a current output stream then the Formatter's tail string is written and the stream is flushed and closed. Then the output stream is replaced with the new output stream.

**Parameters**

<i>stream</i>	The new output stream. May not be NULL.
---------------	---

**Exceptions**

<i>NullPointerException</i>	if the passed stream is NULL.
-----------------------------	-------------------------------

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

**6.783 cms::StreamMessage Class Reference**

Interface for a **StreamMessage** (p. 3760).

```
#include <src/main/cms/StreamMessage.h>
```

Inheritance diagram for cms::StreamMessage:

**Public Member Functions**

- virtual **~StreamMessage** ()

- virtual void **writeString** (const std::string &value)=0 throw ( cms::MessageNotWriteableException, cms::CMSEException )  
*Writes an ASCII String to the Stream message stream.*

### 6.783.1 Detailed Description

Interface for a **StreamMessage** (p. 3760). The stream Messages provides a **Message** (p. 2614) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

**StreamMessage** (p. 3760) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p. 1190). The string-to- primitive conversions may throw a runtime exception if the primitive's `valueOf()` method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X
double								X		X
String	X	X	X		X	X	X	X	X	
byte[]										X

Since

1.3

## 6.783.2 Constructor & Destructor Documentation

**6.783.2.1** virtual cms::StreamMessage::~StreamMessage ( ) [inline, virtual]

## 6.783.3 Member Function Documentation

**6.783.3.1** virtual bool cms::StreamMessage::readBoolean ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]

Reads a Boolean from the Stream message stream.

### Returns

boolean value from stream

### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 541).

**6.783.3.2** `virtual unsigned char cms::StreamMessage::readByte ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]`

Reads a Byte from the Stream message stream.

### Returns

unsigned char value from stream

### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 541).

**6.783.3.3** `virtual int cms::StreamMessage::readBytes ( std::vector< unsigned char > & value ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]`

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

### Parameters

<i>value</i>	buffer to place data in
--------------	-------------------------

### Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 542).

**6.783.3.4** `virtual int cms::StreamMessage::readBytes ( unsigned char * buffer, int length ) const  
throw ( cms::MessageEOFException, cms::MessageFormatException,  
cms::MessageNotReadableException, cms::CMSException ) [pure  
virtual]`

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 1190) is thrown. No bytes will be read from the stream for this exception case.

**Parameters**

<i>buffer</i>	the buffer into which the data is read
<i>length</i>	the number of bytes to read; must be less than or equal to value.length

**Returns**

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.

<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 542).

**6.783.3.5** `virtual char cms::StreamMessage::readChar ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException )` [pure virtual]

Reads a Char from the Stream message stream.

#### Returns

char value from stream

#### Exceptions

<b><i>CMSEException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 543).

**6.783.3.6** `virtual double cms::StreamMessage::readDouble ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException )` [pure virtual]

Reads a 64 bit double from the Stream message stream.

#### Returns

double value from stream

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 544).

**6.783.3.7** `virtual float cms::StreamMessage::readFloat ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]`

Reads a 32 bit float from the Stream message stream.

**Returns**

double value from stream

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 544).

**6.783.3.8** `virtual int cms::StreamMessage::readInt ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]`

Reads a 32 bit signed integer from the Stream message stream.

**Returns**

int value from stream

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 545).

**6.783.3.9** virtual long long cms::StreamMessage::readLong ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]

Reads a 64 bit long from the Stream message stream.

**Returns**

long long value from stream

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 545).

**6.783.3.10** virtual short cms::StreamMessage::readShort ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]

Reads a 16 bit signed short from the Stream message stream.

#### Returns

short value from stream

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 546).

**6.783.3.11** virtual std::string cms::StreamMessage::readString ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]

Reads an ASCII String from the Stream message stream.

#### Returns

String from stream

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 546).

**6.783.3.12** `virtual unsigned short cms::StreamMessage::readUnsignedShort ( ) const throw ( cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException ) [pure virtual]`

Reads a 16 bit unsigned short from the Stream message stream.

### Returns

unsigned short value from stream

### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to read the message due to some internal error.
<b><i>MessageEOFException</i></b> (p. 2747)	- if unexpected end of message stream has been reached.
<b><i>MessageFormatException</i></b> (p. 2749)	- if this type conversion is invalid.
<b><i>MessageNotReadableException</i></b> (p. 2807)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 547).

**6.783.3.13** `virtual void cms::StreamMessage::writeBoolean ( bool value ) throw ( cms::MessageNotWritableException, cms::CMSException ) [pure virtual]`

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

### Parameters

<i>value</i>	boolean to write to the stream
--------------	--------------------------------

### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWritableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 548).

**6.783.3.14** `virtual void cms::StreamMessage::writeByte ( unsigned char value ) throw ( cms::MessageNotWriteableException, cms::CMSException )` [pure virtual]

Writes a byte to the Stream message stream as a 1-byte value.

#### Parameters

<i>value</i>	byte to write to the stream
--------------	-----------------------------

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 548).

**6.783.3.15** `virtual void cms::StreamMessage::writeBytes ( const unsigned char * value, int offset, int length ) throw ( cms::MessageNotWriteableException, cms::CMSException )` [pure virtual]

Writes a portion of a byte array to the Stream message stream.

size as the number of bytes to write.

#### Parameters

<i>value</i>	bytes to write to the stream
<i>offset</i>	the initial offset within the byte array
<i>length</i>	the number of bytes to use

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 548).

**6.783.3.16** `virtual void cms::StreamMessage::writeBytes ( const std::vector< unsigned char > & value ) throw ( cms::MessageNotWriteableException, cms::CMSException ) [pure virtual]`

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

#### Parameters

<i>value</i>	bytes to write to the stream
--------------	------------------------------

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 549).

**6.783.3.17** `virtual void cms::StreamMessage::writeChar ( char value ) throw ( cms::MessageNotWriteableException, cms::CMSException ) [pure virtual]`

Writes a char to the Stream message stream as a 1-byte value.

#### Parameters

<i>value</i>	char to write to the stream
--------------	-----------------------------

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 549).

**6.783.3.18** `virtual void cms::StreamMessage::writeDouble ( double value ) throw ( cms::MessageNotWriteableException, cms::CMSException ) [pure virtual]`

Writes a double to the Stream message stream as a 8 byte value.

#### Parameters

<i>value</i>	double to write to the stream
--------------	-------------------------------

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 550).

**6.783.3.19** `virtual void cms::StreamMessage::writeFloat ( float value ) throw ( cms::MessageNotWriteableException, cms::CMSEException )` [pure virtual]

Writes a float to the Stream message stream as a 4 byte value.

**Parameters**

<i>value</i>	float to write to the stream
--------------	------------------------------

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 550).

**6.783.3.20** `virtual void cms::StreamMessage::writeInt ( int value ) throw ( cms::MessageNotWriteableException, cms::CMSEException )` [pure virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

**Parameters**

<i>value</i>	signed int to write to the stream
--------------	-----------------------------------

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 551).

**6.783.3.21** `virtual void cms::StreamMessage::writeLong ( long long value ) throw ( cms::MessageNotWriteableException, cms::CMSException )` [pure virtual]

Writes a long long to the Stream message stream as a 8 byte value.

#### Parameters

<i>value</i>	signed long long to write to the stream
--------------	---

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 551).

**6.783.3.22** `virtual void cms::StreamMessage::writeShort ( short value ) throw ( cms::MessageNotWriteableException, cms::CMSException )` [pure virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

#### Parameters

<i>value</i>	signed short to write to the stream
--------------	-------------------------------------

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 551).

**6.783.3.23** `virtual void cms::StreamMessage::writeString ( const std::string & value ) throw ( cms::MessageNotWriteableException, cms::CMSException )` [pure virtual]

Writes an ASCII String to the Stream message stream.

#### Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 552).

**6.783.3.24** `virtual void cms::StreamMessage::writeUnsignedShort ( unsigned short value )  
throw ( cms::MessageNotWriteableException, cms::CMSEException )  
[pure virtual]`

Writes a unsigned short to the Stream message stream as a 2 byte value.

**Parameters**

<i>value</i>	unsigned short to write to the stream
--------------	---------------------------------------

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- if the CMS provider fails to write the message due to some internal error.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 552).

The documentation for this class was generated from the following file:

- `src/main/cms/StreamMessage.h`

**6.784 decaf::lang::String Class Reference**

The **String** (p. 3775) class represents an immutable sequence of chars.

```
#include <src/main/decaf/lang/String.h>
```

Inheritance diagram for decaf::lang::String:

**Public Member Functions**

- **String ()**  
*Creates a new empty **String** (p. 3775) object.*

- **String** (const std::string &source)

Create a new **String** (p. 3775) object that represents the given STL string.

- virtual ~**String** ()
- bool **isEmpty** () const
- virtual int **length** () const

#### Returns

the length of the underlying character sequence.

- virtual char **charAt** (int index) const throw ( lang::exceptions::IndexOutOfBoundsException )

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

#### Parameters

index	- position to return the char at.
-------	-----------------------------------

#### Returns

the char at the given position

#### Exceptions

IndexOutOfBoundsException	if index is > than <b>length</b> () (p. 1168) or negative
---------------------------	---

- virtual **CharSequence \* subSequence** (int start, int end) const throw ( lang::exceptions::IndexOutOfBoundsException )

Returns a new **CharSequence** (p. 1167) that is a subsequence of this sequence. The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

#### Parameters

start	- the start index, inclusive
end	- the end index, exclusive

#### Returns

a new **CharSequence** (p. 1167)

#### Exceptions

IndexOutOfBoundsException	if start or end > <b>length</b> () (p. 1168) or start or end are negative.
---------------------------	--

- virtual std::string **toString** () const

#### Returns

the string representation of this **CharSequence** (p. 1167)

### 6.784.1 Detailed Description

The **String** (p. 3775) class represents an immutable sequence of chars.

#### Since

1.0

### 6.784.2 Constructor & Destructor Documentation

#### 6.784.2.1 decaf::lang::String::String ( )

Creates a new empty **String** (p. 3775) object.

#### 6.784.2.2 decaf::lang::String::String ( const std::string & source )

Create a new **String** (p. 3775) object that represents the given STL string.

#### Parameters

<i>source</i>	The string to copy into this new <b>String</b> (p. 3775) object.
---------------	--

#### 6.784.2.3 virtual decaf::lang::String::~~String ( ) [virtual]

### 6.784.3 Member Function Documentation

#### 6.784.3.1 virtual char decaf::lang::String::charAt ( int *index* ) const throw ( lang::exceptions::IndexOutOfBoundsException ) [virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

#### Parameters

<i>index</i>	- position to return the char at.
--------------	-----------------------------------

#### Returns

the char at the given position

#### Exceptions

<i>IndexOutOfBoundsException</i>	if index is > than <b>length()</b> (p. 1168) or negative
----------------------------------	--

Implements **decaf::lang::CharSequence** (p. 1168).

**6.784.3.2** `bool decaf::lang::String::isEmpty ( ) const`

#### Returns

true if the length of this **String** (p. 3775) is zero.

**6.784.3.3** `virtual int decaf::lang::String::length ( ) const` [virtual]

#### Returns

the length of the underlying character sequence.

Implements **decaf::lang::CharSequence** (p. 1168).

**6.784.3.4** `virtual CharSequence* decaf::lang::String::subSequence ( int start, int end ) const`  
`throw ( lang::exceptions::IndexOutOfBoundsException )` [virtual]

Returns a new **CharSequence** (p. 1167) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

#### Parameters

<i>start</i>	- the start index, inclusive
<i>end</i>	- the end index, exclusive

#### Returns

a new **CharSequence** (p. 1167)

#### Exceptions

<i>IndexOutOfBoundsException</i>	if start or end > <b>length()</b> (p. 1168) or start or end are negative.
----------------------------------	---

Implements **decaf::lang::CharSequence** (p. 1168).

**6.784.3.5** `virtual std::string decaf::lang::String::toString ( ) const` [virtual]

#### Returns

the string representation of this **CharSequence** (p. 1167)

Implements **decaf::lang::CharSequence** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**String.h**

## 6.785 decaf::util::StringTokenizer Class Reference

```
#include <src/main/decaf/util/StringTokenizer.h>
```

### Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)  
*Constructs a string tokenizer for the specified string.*
- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () const  
*Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.*
- virtual bool **hasMoreTokens** () const  
*Tests if there are more tokens available from this tokenizer's string.*
- virtual std::string **nextToken** () throw ( lang::exceptions::NoSuchElementException )  
*Returns the next token from this string tokenizer.*
- virtual std::string **nextToken** (const std::string &delim) throw ( lang::exceptions::NoSuchElementException )  
*Returns the next token in this string tokenizer's string.*
- virtual unsigned int **toArray** (std::vector< std::string > &array)  
*Grab all remaining tokens in the String and return them in the vector that is passed in by reference.*
- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)  
*Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.*

### 6.785.1 Constructor & Destructor Documentation

**6.785.1.1 decaf::util::StringTokenizer::StringTokenizer ( const std::string & str, const std::string & delim = " \t\n\r\f", bool returnDelims = false )**

Constructs a string tokenizer for the specified string.

All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if `delim` is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 3779) may result in an Exception.

#### Parameters

<i>str</i>	- The string to tokenize
<i>delim</i>	- String containing the delimiters
<i>returnDelims</i>	- boolean indicating if the delimiters are returned as tokens

6.785.1.2 `virtual decaf::util::StringTokenizer::~StringTokenizer ( ) [virtual]`

### 6.785.2 Member Function Documentation

6.785.2.1 `virtual int decaf::util::StringTokenizer::countTokens ( ) const [virtual]`

Calculates the number of times that this tokenizer's `nextToken` method can be called before it generates an exception.

The current position is not advanced.

#### Returns

Count of remaining tokens

6.785.2.2 `virtual bool decaf::util::StringTokenizer::hasMoreTokens ( ) const [virtual]`

Tests if there are more tokens available from this tokenizer's string.

#### Returns

true if there are more tokens remaining

6.785.2.3 `virtual std::string decaf::util::StringTokenizer::nextToken ( const std::string & delim ) throw ( lang::exceptions::NoSuchElementException ) [virtual]`

Returns the next token in this string tokenizer's string.

First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 3779) object is changed to be the characters in the string `delim`. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

#### Parameters

<i>delim</i>	- string containing the new set of delimiters
--------------	---

**Returns**

next string in the token list

**Exceptions**

<i>NoSuchElementException</i>	
-------------------------------	--

**6.785.2.4** virtual std::string decaf::util::StringTokenizer::nextToken ( ) throw ( lang::exceptions::NoSuchElementException ) [virtual]

Returns the next token from this string tokenizer.

**Returns**

string value of next token

**Exceptions**

<i>NoSuchElementException</i>	
-------------------------------	--

**6.785.2.5** virtual void decaf::util::StringTokenizer::reset ( const std::string & str = "", const std::string & delim = " ", bool returnDelims = false ) [virtual]

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing. If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. If set the delim param will reset the string that this Tokenizer is using to tokenize the string. If set to "", no change is made If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

**Parameters**

<i>str</i>	- New String to tokenize or "", defaults to ""
<i>delim</i>	- New Delimiter String to use or "", defaults to ""
<i>returnDelims</i>	- Should the Tokenizer return delimiters as Tokens, default false

**6.785.2.6** virtual unsigned int decaf::util::StringTokenizer::toArray ( std::vector< std::string > & array ) [virtual]

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

**Parameters**

<i>array</i>	- vector to place token strings in
--------------	------------------------------------

**Returns**

number of string placed into the vector

## 6.786.1 Constructor & Destructor Documentation

6.786.1.1 **activemq::commands::SubscriptionInfo::SubscriptionInfo** ( )

6.786.1.2 **virtual activemq::commands::SubscriptionInfo::~~SubscriptionInfo** ( )  
[virtual]

## 6.786.2 Member Function Documentation

6.786.2.1 **virtual SubscriptionInfo\*** **activemq::commands::SubscriptionInfo::cloneDataStructure** ( ) const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

**6.786.2.2** `virtual void activemq::commands::SubscriptionInfo::copyDataStructure ( const DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

#### Parameters

<i>src</i>	- Source Object
------------	-----------------

Implements `activemq::commands::DataStructure` (p. 1715).

**6.786.2.3** `virtual bool activemq::commands::SubscriptionInfo::equals ( const DataStructure * value ) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if `DataStructure`'s are Equal.

Implements `activemq::commands::DataStructure` (p. 1716).

**6.786.2.4** `virtual const std::string& activemq::commands::SubscriptionInfo::getClientId ( ) const [virtual]`

**6.786.2.5** `virtual std::string& activemq::commands::SubscriptionInfo::getClientId ( ) [virtual]`

**6.786.2.6** `virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new `DataStructure` (p. 1713) type copy.

Implements `activemq::commands::DataStructure` (p. 1717).

- 6.786.2.7 **virtual const Pointer<ActiveMQDestination>&**  
**activemq::commands::SubscriptionInfo::getDestination ( ) const** [virtual]

### 6.787.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3786).  
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.787.2 Constructor & Destructor Documentation

6.787.2.1 `activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller ( ) [inline]`

6.787.2.2 `virtual activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller ( ) [inline, virtual]`

## 6.787.3 Member Function Documentation

6.787.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.787.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.787.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

6.787

**activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller**

**Class Reference**

**3793**

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.787.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.787.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```

6.787.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```

6.787.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

### 6.788.3 Member Function Documentation

6.788.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::createObject (**  
**) const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.788.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::getDataStructureType**  
**( ) const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.788.3.3 **virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseMarshal**  
**( OpenWireFormat \* wireFormat, commands::DataStructure**  
**\* dataStructure, decaf::io::DataOutputStream \* dataOut ) throw (**  
**decaf::io::IOException )** [virtual]

Write a object instance to data output stream.

#### Parameters

6.788

activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller

Class Reference

3797

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.788.3.4** virtual void **activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.788.3.5** virtual int **activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.788.3.6  virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.788.3.7  virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

### 6.789.3 Member Function Documentation

6.789.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::createObject (**  
**) const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.789.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::getDataStructureType**  
**( ) const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.789.3.3 **virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseMarshal**  
**( OpenWireFormat \* wireFormat, commands::DataStructure**  
**\* dataStructure, decaf::io::DataOutputStream \* dataOut ) throw (**  
**decaf::io::IOException )** [virtual]

Write a object instance to data output stream.

6.789

**activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller**

**Class Reference**

**3801**

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.789.3.4** virtual void **activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.789.3.5** virtual int **activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.789.3.6  virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.789.3.7  virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

### 6.790.3 Member Function Documentation

6.790.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::createObject (**  
**) const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.790.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::getDataStructureType**  
**( ) const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.790.3.3 **virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseMarshal**  
**( OpenWireFormat \* wireFormat, commands::DataStructure**  
**\* dataStructure, decaf::io::DataOutputStream \* dataOut ) throw (**  
**decaf::io::IOException )** [virtual]

Write a object instance to data output stream.

6.790

**activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller**

**Class Reference**

**3805**

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.790.3.4** virtual void **activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.790.3.5** virtual int **activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.790.3.6  virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.790.3.7  virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

### 6.791.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3803).  
 NOTE!: This file is auto generated - do not modify! if you need to make a change,  
 please see the Java Classes in the activemq-openwire-generator module

### 6.791.2 Constructor & Destructor Documentation

6.791.2.1 **activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller**  
 ( ) [inline]

6.791.2.2 **virtual activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller**  
 ( ) [inline, virtual]

### 6.791.3 Member Function Documentation

6.791.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::createObject (**  
**) const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.791.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::getDataStructureType**  
**( ) const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.791.3.3 **virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::looseMarshal**  
**( OpenWireFormat \* wireFormat, commands::DataStructure**  
**\* dataStructure, decaf::io::DataOutputStream \* dataOut ) throw (**  
**decaf::io::IOException )** [virtual]

Write a object instance to data output stream.

6.791

activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller

Class Reference

3809

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.791.3.4** virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::looseUnmarshal ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.791.3.5** virtual int activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::tightMarshal1 ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.791.3.6  virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.791.3.7  virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

### 6.792.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3807).  
 NOTE!: This file is auto generated - do not modify! if you need to make a change,  
 please see the Java Classes in the activemq-openwire-generator module

### 6.792.2 Constructor & Destructor Documentation

6.792.2.1 **activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller**  
 ( ) [inline]

6.792.2.2 **virtual activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller**  
 ( ) [inline, virtual]

### 6.792.3 Member Function Documentation

6.792.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::createObject (**  
**) const** [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

6.792.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::getDataStructureType**  
**( ) const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

6.792.3.3 **virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseMarshal**  
**( OpenWireFormat \* wireFormat, commands::DataStructure**  
**\* dataStructure, decaf::io::DataOutputStream \* dataOut ) throw (**  
**decaf::io::IOException )** [virtual]

Write a object instance to data output stream.

6.792

**activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller**

**Class Reference**

**3813**

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1675).

**6.792.3.4** virtual void **activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

**6.792.3.5** virtual int **activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal1** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **utils::BooleanStream** \* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

```
6.792.3.6  virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

```
6.792.3.7  virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

- virtual void **wait** (long long millisecs)=0 throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )  
*Waits on a signal from this object, which is generated by a call to Notify.*
- virtual void **wait** (long long millisecs, int nanos)=0 throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )  
*Waits on a signal from this object, which is generated by a call to Notify.*
- virtual void **notify** ()=0 throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )  
*Signals a waiter on this object that it can now wake up and continue.*
- virtual void **notifyAll** ()=0 throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException )

*Signals the waiters on this object that it can now wake up and continue.*

### 6.793.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since

1.0

### 6.793.2 Constructor & Destructor Documentation

**6.793.2.1** `virtual decaf::util::concurrent::Synchronizable::~~Synchronizable ( ) [inline, virtual]`

### 6.793.3 Member Function Documentation

**6.793.3.1** `virtual void decaf::util::concurrent::Synchronizable::lock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [pure virtual]`

Locks the object.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implemented in `activemq::core::MessageDispatchChannel` (p. 2687), `decaf::internal::util::concurrent::Synchronizable` (p. 3823), `decaf::io::InputStream` (p. 2109), `decaf::io::OutputStream` (p. 2995), `decaf::util::AbstractCollection< E >` (p. 167), `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1274), `decaf::util::concurrent::Mutex` (p. 2868), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3717), `decaf::util::StlQueue< T >` (p. 3727), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 167), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 167), `decaf::util::AbstractCollection< Resource * >` (p. 167), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 167), `decaf::util::AbstractCollection< CompositeTask * >` (p. 167), `decaf::util::AbstractCollection< URI >` (p. 167), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 167), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 167), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 167), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 167), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 167), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 167), `decaf::util::AbstractCollection< cms::Destination * >` (p. 167), `decaf::util::AbstractCollection< cms::Session * >` (p. 167), `decaf::util::AbstractCollection< cms::Connection * >` (p. 167), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1274), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1274), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId`

>, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1274), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1274), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1274), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1274), decaf::util::StlMap< cms::Session \*, SessionResolver \* > (p. 3717), decaf::util::StlMap< std::string, WireFormatFactory \* > (p. 3717), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3717), decaf::util::StlMap< std::string, cms::Queue \* > (p. 3717), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer \*, commands::ProducerId::COMPARATOR > (p. 3717), decaf::util::StlMap< std::string, CachedConsumer \* > (p. 3717), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer \*, commands::ConsumerId::COMPARATOR > (p. 3717), decaf::util::StlMap< std::string, TransportFactory \* > (p. 3717), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3717), decaf::util::StlMap< int, Pointer< Command > > (p. 3717), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher \*, commands::ConsumerId::COMPARATOR > (p. 3717), decaf::util::StlMap< std::string, CachedProducer \* > (p. 3717), decaf::util::StlMap< std::string, cms::Topic \* > (p. 3717), decaf::util::StlQueue< Pointer< Transport > > (p. 3727), decaf::util::StlQueue< Pointer< MessageDispatch > > (p. 3727), decaf::util::StlQueue< Task > (p. 3727), decaf::util::StlQueue< Pointer< Command > > (p. 3727), and decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > > (p. 3727).

```
6.793.3.2 virtual void decaf::util::concurrent::Synchronizable::notify ( )
            throw ( decaf::lang::exceptions::RuntimeException,
                    decaf::lang::exceptions::IllegalMonitorStateException ) [pure
            virtual]
```

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the <b>Synchronizable</b> (p. 3811) Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2687), **decaf::internal::util::concurrent::Synchronizable** (p. 3823), **decaf::io::InputStream** (p. 2110), **decaf::io::OutputStream** (p. 2995), **decaf::util::AbstractCollection< E >** (p. 167), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1274), **decaf::util::concurrent::Mutex** (p. 2868), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3717), **decaf::util::StlQueue< T >** (p. 3727), **decaf::util::AbstractCollection< transport::TransportListener \* >** (p. 167), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 167), **decaf::util::AbstractCollection< Resource \* >** (p. 167), **decaf::util::AbstractCollection< cms::MessageConsumer \* >** (p. 167), **decaf::util::AbstractCollection< CompositeTask \* >** (p. 167), **decaf::util::AbstractCollection< URI >** (p. 167), **decaf::util::AbstractCollection< ActiveMQSession \* >** (p. 167), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 167), **decaf::util::AbstractCollection<**

**PrimitiveValueNode** > > (p. 167), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 167), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 167), **decaf::util::AbstractCollection**< **cms::MessageProducer** \* > (p. 167), **decaf::util::AbstractCollection**< **cms::Destination** \* > (p. 167), **decaf::util::AbstractCollection**< **cms::Session** \* > (p. 167), **decaf::util::AbstractCollection**< **cms::Connection** \* > (p. 167), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **MessageId** >, **Pointer**< **Message** >, **MessageId::COMPARATOR** > (p. 1274), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConnectionId** >, **Pointer**< **ConnectionState** >, **ConnectionId::COMPARATOR** > (p. 1274), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerState** >, **ConsumerId::COMPARATOR** > (p. 1274), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **SessionId** >, **Pointer**< **SessionState** >, **SessionId::COMPARATOR** > (p. 1274), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **LocalTransactionId** >, **Pointer**< **TransactionState** >, **LocalTransactionId::COMPARATOR** > (p. 1274), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ProducerId** >, **Pointer**< **ProducerState** >, **ProducerId::COMPARATOR** > (p. 1274), **decaf::util::StlMap**< **cms::Session** \*, **SessionResolver** \* > (p. 3717), **decaf::util::StlMap**< **std::string**, **WireFormatFactory** \* > (p. 3717), **decaf::util::StlMap**< **std::string**, **PrimitiveValueNode** > (p. 3717), **decaf::util::StlMap**< **std::string**, **cms::Queue** \* > (p. 3717), **decaf::util::StlMap**< **Pointer**< **commands::ProducerId** >, **ActiveMQProducer** \*, **commands::ProducerId::COMPARATOR** > (p. 3717), **decaf::util::StlMap**< **std::string**, **CachedConsumer** \* > (p. 3717), **decaf::util::StlMap**< **Pointer**< **commands::ConsumerId** >, **ActiveMQConsumer** \*, **commands::ConsumerId::COMPARATOR** > (p. 3717), **decaf::util::StlMap**< **std::string**, **TransportFactory** \* > (p. 3717), **decaf::util::StlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerInfo** >, **ConsumerId::COMPARATOR** > (p. 3717), **decaf::util::StlMap**< **int**, **Pointer**< **Command** > > (p. 3717), **decaf::util::StlMap**< **Pointer**< **commands::ConsumerId** >, **Dispatcher** \*, **commands::ConsumerId::COMPARATOR** > (p. 3717), **decaf::util::StlMap**< **std::string**, **CachedProducer** \* > (p. 3717), **decaf::util::StlMap**< **std::string**, **cms::Topic** \* > (p. 3717), **decaf::util::StlQueue**< **Pointer**< **Transport** > > (p. 3727), **decaf::util::StlQueue**< **Pointer**< **MessageDispatch** > > (p. 3727), **decaf::util::StlQueue**< **Task** > (p. 3727), **decaf::util::StlQueue**< **Pointer**< **Command** > > (p. 3727), and **decaf::util::StlQueue**< **decaf::lang::Pointer**< **commands::MessageDispatch** > > (p. 3727).

```

6.793.3.3  virtual void decaf::util::concurrent::Synchronizable::notifyAll ( )
            throw ( decaf::lang::exceptions::RuntimeException,
                    decaf::lang::exceptions::IllegalMonitorStateException ) [pure
            virtual]
  
```

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

### Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the <b>Synchronizable</b> (p. 3811) Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2687), **decaf::internal::util::concurrent::Synchronizable** (p. 3824), **decaf::io::InputStream** (p. 2110), **decaf::io::OutputStream** (p. 2995),

decaf::util::AbstractCollection< E > (p. 167), decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1275), decaf::util::concurrent::Mutex (p. 2868), decaf::util::StlMap< K, V, COMPARATOR > (p. 3717), decaf::util::StlQueue< T > (p. 3727), decaf::util::AbstractCollection< transport::TransportListener \* > (p. 167), decaf::util::AbstractCollection< Pointer< Synchronization > > (p. 167), decaf::util::AbstractCollection< Resource \* > (p. 167), decaf::util::AbstractCollection< cms::MessageConsumer \* > (p. 167), decaf::util::AbstractCollection< CompositeTask \* > (p. 167), decaf::util::AbstractCollection< URI > (p. 167), decaf::util::AbstractCollection< ActiveMQSession \* > (p. 167), decaf::util::AbstractCollection< Pointer< DestinationInfo > > (p. 167), decaf::util::AbstractCollection< PrimitiveValueNode > (p. 167), decaf::util::AbstractCollection< Pointer< Command > > (p. 167), decaf::util::AbstractCollection< Pointer< BackupTransport > > (p. 167), decaf::util::AbstractCollection< cms::MessageProducer \* > (p. 167), decaf::util::AbstractCollection< cms::Destination \* > (p. 167), decaf::util::AbstractCollection< cms::Session \* > (p. 167), decaf::util::AbstractCollection< cms::Connection \* > (p. 167), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1275), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1275), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1275), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1275), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1275), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1275), decaf::util::StlMap< cms::Session \*, SessionResolver \* > (p. 3717), decaf::util::StlMap< std::string, WireFormatFactory \* > (p. 3717), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3717), decaf::util::StlMap< std::string, cms::Queue \* > (p. 3717), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer \*, commands::ProducerId::COMPARATOR > (p. 3717), decaf::util::StlMap< std::string, CachedConsumer \* > (p. 3717), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer \*, commands::ConsumerId::COMPARATOR > (p. 3717), decaf::util::StlMap< std::string, TransportFactory \* > (p. 3717), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3717), decaf::util::StlMap< int, Pointer< Command > > (p. 3717), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher \*, commands::ConsumerId::COMPARATOR > (p. 3717), decaf::util::StlMap< std::string, CachedProducer \* > (p. 3717), decaf::util::StlMap< std::string, cms::Topic \* > (p. 3717), decaf::util::StlQueue< Pointer< Transport > > (p. 3727), decaf::util::StlQueue< Pointer< MessageDispatch > > (p. 3727), decaf::util::StlQueue< Task > (p. 3727), decaf::util::StlQueue< Pointer< Command > > (p. 3727), and decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > > (p. 3727).

**6.793.3.4** virtual bool decaf::util::concurrent::Synchronizable::tryLock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [pure virtual]

Attempts to **Lock** (p. 2450) the object, if the lock is already held by another thread than this method returns false.

### Returns

true if the lock was acquired, false if it is already held by another thread.

### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.

**6.793.3.7** virtual void decaf::util::concurrent::Synchronizable::wait ( long long *millisecs* ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

#### Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

#### Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the <b>Synchronizable</b> (p. 3811) Object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2689), **decaf::internal::util::concurrent::Synchronizable** (p. 3825), **decaf::io::InputStream** (p. 2115), **decaf::io::OutputStream** (p. 2997), **decaf::util::AbstractCollection< E >** (p. 172), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1281), **decaf::util::concurrent::Mutex** (p. 2870), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3721), **decaf::util::StlQueue< T >** (p. 3730), **decaf::util::AbstractCollection< transport::TransportListener \* >** (p. 172), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 172), **decaf::util::AbstractCollection< Resource \* >** (p. 172), **decaf::util::AbstractCollection< cms::MessageConsumer \* >** (p. 172), **decaf::util::AbstractCollection< CompositeTask \* >** (p. 172), **decaf::util::AbstractCollection< URI >** (p. 172), **decaf::util::AbstractCollection< ActiveMQSession \* >** (p. 172), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 172), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 172), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 172), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 172), **decaf::util::AbstractCollection< cms::MessageProducer \* >** (p. 172), **decaf::util::AbstractCollection< cms::Destination \* >** (p. 172), **decaf::util::AbstractCollection< cms::Session \* >** (p. 172), **decaf::util::AbstractCollection< cms::Connection \* >**

**6.793.3.8** `virtual void decaf::util::concurrent::Synchronizable::wait ( long long milliseconds, int nanos ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException )` [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

#### Parameters

<i>milliseconds</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

## Exceptions

<i>IllegalArgumentException</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the <b>Synchronizable</b> (p. 3811) Object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2689), **decaf::internal::util::concurrent::Synchronizable** (p. 3825), **decaf::io::InputStream** (p. 2116), **decaf::io::OutputStream** (p. 2997), **decaf::util::AbstractCollection< E >** (p. 172), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1282), **decaf::util::concurrent::Mutex** (p. 2871), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3721), **decaf::util::StlQueue< T >** (p. 3730), **decaf::util::AbstractCollection< transport::TransportListener \* >** (p. 172), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 172), **decaf::util::AbstractCollection< Resource \* >** (p. 172), **decaf::util::AbstractCollection< cms::MessageConsumer \* >** (p. 172), **decaf::util::AbstractCollection< CompositeTask \* >** (p. 172), **decaf::util::AbstractCollection< URI >** (p. 172), **decaf::util::AbstractCollection< ActiveMQSession \* >** (p. 172), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 172), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 172), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 172), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 172), **decaf::util::AbstractCollection< cms::MessageProducer \* >** (p. 172), **decaf::util::AbstractCollection< cms::Destination \* >** (p. 172), **decaf::util::AbstractCollection< cms::Session \* >** (p. 172), **decaf::util::AbstractCollection< cms::Connection \* >** (p. 172), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1282), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1282), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1282), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1282), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1282), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1282), **decaf::util::StlMap< cms::Session \*, SessionResolver \* >** (p. 3721), **decaf::util::StlMap< std::string, WireFormatFactory \* >** (p. 3721), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3721), **decaf::util::StlMap< std::string, cms::Queue \* >** (p. 3721), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer \*, commands::ProducerId::COMPARATOR >** (p. 3721), **decaf::util::StlMap< std::string, CachedConsumer \* >** (p. 3721), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer \*, commands::ConsumerId::COMPARATOR >** (p. 3721), **decaf::util::StlMap< std::string, TransportFactory \* >** (p. 3721), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 3721), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3721), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher \*, commands::ConsumerId::COMPARATOR >** (p. 3721), **decaf::util::StlMap< std::string, CachedProducer \* >** (p. 3721), **decaf::util::StlMap< std::string, cms::Topic \* >** (p. 3721), **decaf::util::StlQueue< Pointer< Transport > >** (p. 3730), **decaf::util::StlQueue< Pointer< MessageDispatch > >** (p. 3730), **decaf::util::StlQueue< Task >** (p. 3730), **decaf::util::StlQueue<**

**Pointer**< **Command** > > (p. 3730), and **decaf::util::StlQueue**< **decaf::lang::Pointer**< **commands::MessageDispatch** > > (p. 3730).

### 6.794.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since

1.0

### 6.794.2 Constructor & Destructor Documentation

6.794.2.1 decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ( )

6.794.2.2 virtual decaf::internal::util::concurrent::SynchronizableImpl::~SynchronizableImpl ( ) [virtual]

### 6.794.3 Member Function Documentation

6.794.3.1 virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [virtual]

Locks the object.

#### Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements decaf::util::concurrent::Synchronizable (p. 3812).

6.794.3.2 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify ( ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException ) [virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

**Exceptions**

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3813).

**6.794.3.3** `virtual void decaf::internal::util::concurrent::SynchronizableImpl::notifyAll ( ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException ) [virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

**Exceptions**

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3814).

**6.794.3.4** `virtual bool decaf::internal::util::concurrent::SynchronizableImpl::tryLock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

**Returns**

true if the lock was acquired, false if it is already held by another thread.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 3815).

**6.794.3.5** `virtual void decaf::internal::util::concurrent::SynchronizableImpl::unlock ( ) throw ( decaf::lang::exceptions::RuntimeException ) [virtual]`

Unlocks the object.

**Exceptions**

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

## 6.794 decaf::internal::util::concurrent::SynchronizableImpl Class Reference 3829

Implements **decaf::util::concurrent::Synchronizable** (p. 3816).

**6.794.3.6** virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait ( ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

### Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3818).

**6.794.3.7** virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait ( long long *millisecs* ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

### Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

### Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3819).

6.794.3.8 `virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait ( long long millisecs, int nanos ) throw ( decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException ) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

#### Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

#### Exceptions

<i>IllegalArgumentException</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3820).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/util/concurrent/SynchronizableImpl.h`

## 6.795 activemq::core::Synchronization Class Reference

Transacted Object **Synchronization** (p. 3826), used to sync the events of a Transaction with the items in the Transaction.

```
#include <src/main/activemq/core/Synchronization.h>
```

#### Public Member Functions

- `virtual ~Synchronization ()`
- `virtual void beforeEnd ()=0 throw ( exceptions::ActiveMQException )`
- `virtual void afterCommit ()=0 throw ( exceptions::ActiveMQException )`

*Removes at most the given number of available elements from this queue and adds them to the given collection.*

### 6.796.1 Detailed Description

template<typename E> class decaf::util::concurrent::SynchronousQueue< E >

A **blocking queue** (p. 848) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa. A synchronous queue does not have any internal capacity, not even a capacity of one. You cannot **peek** at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and **poll()** (p. 3834) will return **null**. For purposes of other **Collection** (p. 1216) methods (for example

contains), a **SynchronousQueue** (p. 3827) acts as an empty collection. This queue does not permit `null` elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to `true` grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the **Collection** (p. 1216) and **Iterator** (p. 2222) interfaces.

Since

1.0

## 6.796.2 Constructor & Destructor Documentation

6.796.2.1 `template<typename E> decaf::util::concurrent::SynchronousQueue< E>::SynchronousQueue( ) [inline]`

6.796.2.2 `template<typename E> virtual decaf::util::concurrent::SynchronousQueue< E>::~SynchronousQueue( ) [inline, virtual]`

## 6.796.3 Member Function Documentation

6.796.3.1 `template<typename E> virtual void decaf::util::concurrent::SynchronousQueue< E>::clear( ) throw ( lang::exceptions::UnsupportedOperationException ) [inline, virtual]`

Removes all elements of the queue.

This implementation repeatedly invokes `poll` until it returns the empty marker.

Reimplemented from `decaf::util::AbstractQueue< E>` (p. 178).

6.796.3.2 `template<typename E> virtual bool decaf::util::concurrent::SynchronousQueue< E>::contains( const E &value DECAF_UNUSED ) const throw ( lang::Exception ) [inline, virtual]`

6.796.3.3 `template<typename E> virtual bool decaf::util::concurrent::SynchronousQueue< E>::containsAll( const Collection< E> &collection ) const throw ( lang::Exception ) [inline, virtual]`

Returns true if this collection contains all of the elements in the specified collection.

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

#### Parameters

<i>collection</i>	collection to be checked for containment in this collection
-------------------	---

#### Returns

true if this collection contains all of the elements in the specified collection.

#### Exceptions

<i>Exception</i>	if an error occurs,
------------------	---------------------

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 165).

```
6.796.3.4 template<typename E > virtual std::size_t
decaf::util::concurrent::SynchronousQueue<
E >::drainTo ( Collection< E > & c ) throw ( de-
caaf::lang::exceptions::UnsupportedOperationException,
decaf::lang::exceptions::IllegalArgumentException ) [inline,
virtual]
```

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

#### Parameters

<i>c</i>	the collection to transfer elements into
----------	--

#### Returns

the number of elements transferred

#### Exceptions

<i>UnsupportedOperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgumentException</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 852).

References `decaf::util::AbstractQueue< E >::element()`, and `decaf::util::concurrent::SynchronousQueue< E >::poll()`.

```
6.796.3.5  template<typename E > virtual std::size_t
           decaf::util::concurrent::SynchronousQueue< E
           >::drainTo ( Collection< E > & c, std::size_t maxElements ) throw
           ( decaf::lang::exceptions::UnsupportedOperationException,
           decaf::lang::exceptions::IllegalArgumentException ) [inline,
           virtual]
```

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

#### Parameters

<code>c</code>	the collection to transfer elements into
<code>maxElements</code>	the maximum number of elements to transfer

#### Returns

the number of elements transferred

#### Exceptions

<i>UnsupportedOperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgumentException</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements `decaf::util::concurrent::BlockingQueue< E >` (p. 852).

References `decaf::util::AbstractQueue< E >::element()`, and `decaf::util::concurrent::SynchronousQueue< E >::poll()`.

```
6.796.3.6  template<typename E > virtual bool
           decaf::util::concurrent::SynchronousQueue< E
           >::equals ( const Collection< E > & collection ) const [inline,
           virtual]
```

Answers true if this **Collection** (p. 1216) and the one given are the same size and if each element contained in the **Collection** (p. 1216) given is equal to an element contained in this collection.

### Parameters

<i>collection</i>	- The <b>Collection</b> (p. 1216) to be compared to this one.
-------------------	---

### Returns

true if this **Collection** (p. 1216) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 166).

```
6.796.3.7  template<typename E > virtual bool  
           decaf::util::concurrent::SynchronousQueue< E  
           >::isEmpty ( ) const [inline, virtual]
```

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 3837) == 0.

### Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 166).

```
6.796.3.8  template<typename E > virtual decaf::util::Iterator<E>*  
           decaf::util::concurrent::SynchronousQueue< E >::iterator ( ) const  
           [inline, virtual]
```

Implements **decaf::lang::Iterable< E >** (p. 2222).

```
6.796.3.9  template<typename E > virtual decaf::util::Iterator<E>*  
           decaf::util::concurrent::SynchronousQueue< E >::iterator ( )  
           [inline, virtual]
```

### Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 2221).

```
6.796.3.10 template<typename E > virtual bool  
           decaf::util::concurrent::SynchronousQueue< E  
           >::offer ( const E & e, long timeout, const TimeUnit & unit )  
           throw ( decaf::lang::exceptions::InterruptedException,  
                   decaf::lang::exceptions::NullPointerException,  
                   decaf::lang::exceptions::IllegalArgumentException ) [inline,  
                               virtual]
```

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

**Returns**

`true` if successful, or `false` if the specified waiting time elapses before a consumer appears.

**Exceptions**

<i>InterruptedException</i>	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
<i>NullPointerException</i>	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
<i>IllegalArgumentException</i>	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 853).

```
6.796.3.11  template<typename E > virtual bool
             decaf::util::concurrent::SynchronousQueue< E >::offer ( const E
             & value ) throw ( decaf::lang::exceptions::NullPointerException,
             decaf::lang::exceptions::IllegalArgumentException ) [inline,
             virtual]
```

Inserts the specified element into this queue, if another thread is waiting to receive it.

**Parameters**

<i>value</i>	the element to add to the <b>Queue</b> (p. 3239)
--------------	--

**Returns**

`true` if the element was added to this queue, else `false`

**Exceptions**

<i>NullPointerException</i>	if the <b>Queue</b> (p. 3239) implementation does not allow Null values to be inserted into the <b>Queue</b> (p. 3239).
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 3241).

6.796.3.12 `template<typename E > virtual bool  
decaf::util::concurrent::SynchronousQueue< E  
>::peek ( E &result DECAF_UNUSED ) const [inline, virtual]`

6.796.3.13 `template<typename E > virtual bool  
decaf::util::concurrent::SynchronousQueue< E  
>::poll ( E &result, long long timeout, const TimeUnit &unit ) throw (   
decaf::lang::exceptions::InterruptedException ) [inline,  
virtual]`

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

#### Parameters

<i>result</i>	a reference to the value where the head of the <b>Queue</b> (p. 3239) should be copied to.
<i>timeout</i>	the time that the method should block if there is no element available to return.
<i>unit</i>	the Time Units that the timeout value represents.

#### Returns

true if the head of the **Queue** (p. 3239) was copied to the result param or false if no value could be returned.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 854).

Referenced by **decaf::util::concurrent::SynchronousQueue< E >::drainTo()**.

6.796.3.14 `template<typename E > virtual bool  
decaf::util::concurrent::SynchronousQueue< E  
>::poll ( E &result ) [inline, virtual]`

Retrieves and removes the head of this queue, if another thread is currently making an element available.

#### Parameters

<i>result</i>	a reference to the value where the head of the <b>Queue</b> (p. 3239) should be copied to.
---------------	--

#### Returns

true if the head of the **Queue** (p. 3239) was copied to the result param or false if no value could be returned.

Implements **decaf::util::Queue< E >** (p. 3242).

```

6.796.3.15  template<typename E > virtual void
             decaf::util::concurrent::SynchronousQueue< E >::put
             ( const E & value ) throw ( decaf::lang::exceptions::InterruptedException,
             decaf::lang::exceptions::NullPointerException,
             decaf::lang::exceptions::IllegalArgumentException ) [inline,
             virtual]

```

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

#### Parameters

<i>value</i>	the element to add to the <b>Queue</b> (p. 3239).
--------------	---

#### Exceptions

<i>InterruptedException</i>	Inserts the specified element into this queue, waiting if necessary for space to become available.
<i>NullPointerException</i>	Inserts the specified element into this queue, waiting if necessary for space to become available.
<i>IllegalArgumentException</i>	Inserts the specified element into this queue, waiting if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 854).

```

6.796.3.16  template<typename E > virtual int
             decaf::util::concurrent::SynchronousQueue< E
             >::remainingCapacity( ) const [inline, virtual]

```

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

#### Returns

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 855).

- 6.796.3.17 `template<typename E > virtual bool  
decaf::util::concurrent::SynchronousQueue< E  
>::remove ( const E &value DECAF_UNUSED ) throw (   
lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException ) [inline,  
virtual]`
- 6.796.3.18 `template<typename E > virtual bool  
decaf::util::concurrent::SynchronousQueue< E  
>::removeAll ( const Collection< E > &collection DECAF_UNUSED )  
throw ( lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException ) [inline,  
virtual]`
- 6.796.3.19 `template<typename E > virtual bool  
decaf::util::concurrent::SynchronousQueue< E  
>::retainAll ( const Collection< E > &collection DECAF_UNUSED )  
throw ( lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException ) [inline,  
virtual]`
- 6.796.3.20 `template<typename E > virtual std::size_t  
decaf::util::concurrent::SynchronousQueue< E  
>::size ( ) const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX\_VALUE elements, returns Integer.MAX\_VALUE.

#### Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1226).

- 6.796.3.21 `template<typename E > virtual E  
decaf::util::concurrent::SynchronousQueue< E  
>::take ( ) throw ( decaf::lang::exceptions::InterruptedException )  
[inline, virtual]`

Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.

#### Returns

the head of this queue

#### Exceptions

<i>InterruptedException</i>	Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.
-----------------------------	--

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 855).

```
6.796.3.22 template<typename E > virtual std::vector<E>
decaf::util::concurrent::SynchronousQueue< E >::toArray ( ) const
[inline, virtual]
```

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1216).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

### Returns

an vector of copies of all the elements from this **Collection** (p. 1216)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 170).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/SynchronousQueue.h

## 6.797 decaf::lang::System Class Reference

The **System** (p. 3838) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.

```
#include <src/main/decaf/lang/System.h>
```

### Public Member Functions

- virtual **~System** ()

### Static Public Member Functions

- static void **arraycopy** (const unsigned char \*src, std::size\_t srcPos, unsigned char \*dest, std::size\_t destPos, std::size\_t length)

*Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.*

- static void **arraycopy** (const short \*src, std::size\_t srcPos, short \*dest, std::size\_t destPos, std::size\_t length)

*Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.*

- static void **arraycopy** (const int \*src, std::size\_t srcPos, int \*dest, std::size\_t destPos, std::size\_t length)  
*Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.*
- static void **arraycopy** (const long long \*src, std::size\_t srcPos, long long \*dest, std::size\_t destPos, std::size\_t length)  
*Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.*
- static const **util::Map**< std::string, std::string > & **getenv** ()  
*Enumerates the system environment and returns a map of env variable names to the string values they hold.*
- static std::string **getenv** (const std::string &name)  
*Reads an environment value from the system and returns it as a string object.*
- static void **unsetenv** (const std::string &name)  
*Clears a set environment value if one is set.*
- static void **setenv** (const std::string &name, const std::string &value)  
*Sets the specified system property to the value given.*
- static long long **currentTimeMillis** ()  
*Returns the current time in milliseconds.*
- static long long **nanoTime** ()  
*Returns the current value of the most precise available system timer, in nanoseconds.*
- static int **availableProcessors** ()  
*Returns the number of processors available for execution of Decaf Threads.*
- static **decaf::util::Properties** & **getProperties** ()  
*Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.*
- static std::string **getProperty** (const std::string &key)  
*Gets the specified **System** (p. 3838) property if set, otherwise returns an empty string.*
- static std::string **getProperty** (const std::string &key, const std::string &default-Value)  
*Gets the specified **System** (p. 3838) property if set, otherwise returns the specified default value.*

- static std::string **setProperty** (const std::string &key, const std::string &value)  
*Sets the **System** (p. 3838) Property to the specified value.*
- static std::string **clearProperty** (const std::string &key)  
*Clear any value associated with the system property specified.*

### 6.797.1 Detailed Description

The **System** (p. 3838) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.

#### Since

1.0

### 6.797.2 Constructor & Destructor Documentation

**6.797.2.1** **decaf::lang::System::System** ( ) [protected]

**6.797.2.2** **virtual decaf::lang::System::~~System** ( ) [inline, virtual]

### 6.797.3 Member Function Documentation

**6.797.3.1** **static void decaf::lang::System::arraycopy** ( const unsigned char \* *src*, std::size\_t *srcPos*, unsigned char \* *dest*, std::size\_t *destPos*, std::size\_t *length* ) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

#### Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

**Exceptions**

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

Referenced by decaf::lang::ArrayPointer< unsigned char >::clone().

**6.797.3.2** `static void decaf::lang::System::arraycopy ( const short * src, std::size_t srcPos, short * dest, std::size_t destPos, std::size_t length ) [static]`

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

**Parameters**

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

**Exceptions**

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

**6.797.3.3** `static void decaf::lang::System::arraycopy ( const long long * src, std::size_t srcPos, long long * dest, std::size_t destPos, std::size_t length ) [static]`

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

**Parameters**

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

**Exceptions**

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

**6.797.3.4** `static void decaf::lang::System::arraycopy ( const int * src, std::size_t srcPos, int * dest, std::size_t destPos, std::size_t length )` [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

#### Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

#### Exceptions

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

**6.797.3.5** `static int decaf::lang::System::availableProcessors ( )` [static]

Returns the number of processors available for execution of Decaf Threads.

This value may change during a particular execution of a Decaf based application. Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

#### Returns

the number of available processors.

**6.797.3.6** `static std::string decaf::lang::System::clearProperty ( const std::string & key )`  
[static]

Clear any value associated with the system property specified.

#### Parameters

<i>key</i>	The key name of the system property to clear.
------------	---

#### Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

#### Exceptions

<i>IllegalArgumentException</i>	if key is an empty string.
---------------------------------	----------------------------

**6.797.3.7** `static long long decaf::lang::System::currentTimeMillis ( ) [static]`

Returns the current time in milliseconds.

Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

#### Returns

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

**6.797.3.8** `static const util::Map<std::string, std::string>& decaf::lang::System::getenv ( ) [static]`

Enumerates the system environment and returns a map of env variable names to the string values they hold.

#### Returns

A Map of all environment variables.

#### Exceptions

<i>Exception</i> (p. 1886)	if an error occurs while getting the Environment Map.
----------------------------	---

**6.797.3.9** `static std::string decaf::lang::System::getenv ( const std::string & name ) [static]`

Reads an environment value from the system and returns it as a string object.

#### Parameters

<i>name</i>	The environment variable to read.
-------------	-----------------------------------

#### Returns

a string with the value from the variables or ""

#### Exceptions

<i>an</i>	<b>Exception</b> (p. 1886) if an error occurs while reading the Env.
-----------	--

**6.797.3.10** `static decaf::util::Properties& decaf::lang::System::getProperties ( )`  
`[static]`

Gets the Properties object that holds the Properties accessed from calls to `getProperty` and `setProperty`.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

#### Returns

a reference to the static system Properties object.

**6.797.3.11** `static std::string decaf::lang::System::getProperty ( const std::string & key )`  
`[static]`

Gets the specified **System** (p. 3838) property if set, otherwise returns an empty string.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

#### Parameters

<i>key</i>	The key name of the desired system property to retrieve.
------------	--

#### Returns

an empty string if the named property is not set, otherwise returns the value.

#### Exceptions

<i>IllegalArgumentEx- ception</i>	if key is an empty string.
---------------------------------------	----------------------------

**6.797.3.12** `static std::string decaf::lang::System::getProperty ( const std::string & key, const std::string & defaultValue )` `[static]`

Gets the specified **System** (p. 3838) property if set, otherwise returns the specified default value.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

#### Parameters

<i>key</i>	The key name of the desired system property to retrieve.
<i>defaultValue</i>	The default value to return if the key is not set in the <b>System</b> (p. 3838) properties.

**Returns**

the value of the named system property or the default value if the property isn't set..

**Exceptions**

<i>IllegalArgumentException</i>	if key is an empty string.
---------------------------------	----------------------------

**6.797.3.13 static long long decaf::lang::System::nanoTime ( ) [static]**

Returns the current value of the most precise available system timer, in nanoseconds.

This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

```
long long startTime = System::nanoTime() (p. 3845); // ... the code being measured
... long long estimatedTime = System::nanoTime() (p. 3845) - startTime;
```

**Returns**

The current value of the system timer, in nanoseconds.

**6.797.3.14 static void decaf::lang::System::setenv ( const std::string & name, const std::string & value ) [static]**

Sets the specified system property to the value given.

**Parameters**

<i>name</i>	The name of the environment variables to set.
<i>value</i>	The value to assign to name.

**Exceptions**

<i>an</i>	<b>Exception</b> (p. 1886) if an error occurs when setting the environment variable.
-----------	--

**6.797.3.15** `static std::string decaf::lang::System::setProperty ( const std::string & key, const std::string & value )` `[static]`

Sets the **System** (p. 3838) Property to the specified value.

#### Parameters

<i>key</i>	The key name of the system property to set to the given value.
<i>value</i>	The value to assign to the key.

#### Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

#### Exceptions

<i>IllegalArgumentException</i>	if key is an empty string.
---------------------------------	----------------------------

**6.797.3.16** `static void decaf::lang::System::unsetenv ( const std::string & name )` `[static]`

Clears a set environment value if one is set.

#### Parameters

<i>name</i>	The environment variables to clear.
-------------	-------------------------------------

#### Exceptions

<i>an</i>	<b>Exception</b> (p. 1886) if an error occurs while reading the environment.
-----------	--

## 6.797.4 Friends And Related Function Documentation

**6.797.4.1** `friend class decaf::lang::Runtime` `[friend]`

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/System.h`

## 6.798 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

```
#include <src/main/activemq/threads/Task.h>
```

Inheritance diagram for `activemq::threads::Task`:

## Public Member Functions

- virtual `~Task()`
- virtual `bool iterate()=0`

*Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.*

### 6.798.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since

3.0

### 6.798.2 Constructor & Destructor Documentation

6.798.2.1 virtual `activemq::threads::Task::~~Task()` [`inline`, `virtual`]

### 6.798.3 Member Function Documentation

6.798.3.1 virtual `bool activemq::threads::Task::iterate()` [`pure virtual`]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

**Returns**

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in `activemq::core::ActiveMQSessionExecutor` (p. 535), `activemq::threads::CompositeTaskRunner` (p. 1257), `activemq::transport::failover::BackupTransportPool` (p. 764), `activemq::transport::failover::CloseTransportPool` (p. 1183), and `activemq::transport::failover::FailoverTransport` (p. 1937).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/Task.h`

## 6.799 decaf::util::concurrent::TaskListener Class Reference

```
#include <src/main/decaf/util/concurrent/TaskListener.h>
```

## Public Member Functions

- virtual `~TaskListener ()`
- virtual void `onTaskComplete (lang::Runnable *task)=0`  
*Called when a queued task has completed, the task that finished is passed along for user consumption.*
- virtual void `onTaskException (lang::Runnable *task, lang::Exception &ex)=0`  
*Called when a queued task has thrown an exception while being run.*

## 6.799.1 Constructor & Destructor Documentation

- 6.799.1.1 `virtual decaf::util::concurrent::TaskListener::~~TaskListener ( ) [inline, virtual]`

## 6.799.2 Member Function Documentation

- 6.799.2.1 `virtual void decaf::util::concurrent::TaskListener::onTaskComplete ( lang::Runnable * task ) [pure virtual]`

Called when a queued task has completed, the task that finished is passed along for user consumption.

### Parameters

<i>task</i>	Runnable Pointer to the task that finished
-------------	--

- 6.799.2.2 `virtual void decaf::util::concurrent::TaskListener::onTaskException ( lang::Runnable * task, lang::Exception & ex ) [pure virtual]`

Called when a queued task has thrown an exception while being run.

The Callee should assume that this was an unrecoverable exception and that this task is now defunct.

### Parameters

<i>task</i>	Runnable Pointer to the task
<i>ex</i>	The ActiveMQException that was thrown.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TaskListener.h`

## 6.800 activemq::threads::TaskRunner Class Reference

```
#include <src/main/activemq/threads/TaskRunner.h>
```

Inheritance diagram for activemq::threads::TaskRunner:

### Public Member Functions

- virtual **~TaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)=0  
*Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.*
- virtual void **shutdown** ()=0  
*Shutdown once the task has finished and the TaskRunner's thread has exited.*
- virtual void **wakeup** ()=0  
*Signal the **TaskRunner** (p. 3849) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3846) instance will be run until its iterate method has returned false indicating it is done.*

### 6.800.1 Constructor & Destructor Documentation

**6.800.1.1** virtual activemq::threads::TaskRunner::~TaskRunner ( ) [inline, virtual]

### 6.800.2 Member Function Documentation

**6.800.2.1** virtual void activemq::threads::TaskRunner::shutdown ( unsigned int *timeout* ) [pure virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

#### Parameters

<i>timeout</i>	- Time in Milliseconds to wait for the task to stop.
----------------	--

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1258), and **activemq::threads::DedicatedTaskRunner** (p. 1726).

**6.800.2.2** virtual void activemq::threads::TaskRunner::shutdown ( ) [pure virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implemented in `activemq::threads::CompositeTaskRunner` (p. 1258), and `activemq::threads::DedicatedTaskRunner` (p. 1725).

**6.800.2.3** `virtual void activemq::threads::TaskRunner::wakeup ( )` [pure virtual]

Signal the **TaskRunner** (p. 3849) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3846) instance will be run until its `iterate` method has returned false indicating it is done.

Implemented in `activemq::threads::CompositeTaskRunner` (p. 1258), and `activemq::threads::DedicatedTaskRunner` (p. 1726).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/TaskRunner.h`

## 6.801 decaf::internal::net::tcp::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

```
#include <src/main/decaf/internal/net/tcp/TcpSocket.h>
```

Inheritance diagram for `decaf::internal::net::tcp::TcpSocket`:

### Public Member Functions

- **TcpSocket** () throw ( `decaf::net::SocketException` )  
*Construct a non-connected socket.*
- virtual **~TcpSocket** ()  
*Releases the socket handle but not gracefully shut down the connection.*
- SocketHandle **getSocketHandle** ()  
*Gets the handle for the socket.*
- bool **isConnected** () const
- bool **isClosed** () const
- virtual std::string **getLocalAddress** () const  
*Gets the value of the local Inet address the **Socket** (p. 3607) is bound to if bound, otherwise return the **InetAddress** (p. 2077) ANY value "0.0.0.0".*  
**Returns**  
*the local address bound to, or ANY.*
- virtual void **create** () throw ( `decaf::io::IOException` )

Creates the underlying platform **Socket** (p. 3607) data structures which allows for **Socket** (p. 3607) options to be applied.

The created socket is in an unconnected state.

#### Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual void **accept** (SocketImpl \*socket) throw ( decaf::io::IOException )
- virtual void **bind** (const std::string &ipaddress, int **port**) throw ( decaf::io::IOException )

Binds this **Socket** (p. 3607) instance to the local ip address and port number given.

#### Parameters

ipaddress	The address of local ip to bind to.
port	The port number on the host to bind to.

#### Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual void **connect** (const std::string &hostname, int **port**, int timeout) throw ( decaf::io::IOException, decaf::net::SocketException, decaf::lang::exceptions::IllegalArgumentException )

Connects this socket to the given host and port.

#### Parameters

hostname	The name of the host to connect to, or IP address.
port	The port number on the host to connect to.
timeout	Time in milliseconds to wait for a connection, 0 indicates forever.

#### Exceptions

IOException	if an I/O error occurs while attempting this operation.
<b>SocketTimeoutException</b> (p. 3650)	if the connect call times out due to timeout being set.
IllegalArgumentEx-ception	if a parameter has an illegal value.

- virtual void **listen** (int backlog) throw ( decaf::io::IOException )

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

#### Parameters

backlog	The maximum length of the connection queue.
---------	---

#### Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual **decaf::io::InputStream \* getInputStream ()** throw ( decaf::io::IOException )

*Gets the InputStream linked to this **Socket** (p. 3607).*

**Returns**

*an InputStream pointer owned by the **Socket** (p. 3607) object.*

**Exceptions**

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

- virtual **decaf::io::OutputStream \* getOutputStream ()** throw ( decaf::io::IOException )

*Gets the OutputStream linked to this **Socket** (p. 3607).*

**Returns**

*an OutputStream pointer owned by the **Socket** (p. 3607) object.*

**Exceptions**

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

- virtual int **available ()** throw ( decaf::io::IOException )

*Gets the number of bytes that can be read from the **Socket** (p. 3607) without blocking.*

**Returns**

*the number of bytes that can be read from the **Socket** (p. 3607) without blocking.*

**Exceptions**

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

- virtual void **close ()** throw ( decaf::io::IOException )

*Closes the socket, terminating any blocked reads or writes.*

**Exceptions**

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

- virtual void **shutdownInput ()** throw ( decaf::io::IOException )

*Places the input stream for this socket at "end of stream".*

*Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 3643) on the socket, the stream will return EOF.*

**Exceptions**

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

- virtual void **shutdownOutput ()** throw ( decaf::io::IOException )

*Disables the output stream for this socket.*

*For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking*

*shutdownOutput()* (p. 3643) on the socket, the stream will throw an *IOException*.

#### Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual int **getOption** (int option) const throw ( decaf::io::IOException )

*Gets the specified **Socket** (p. 3607) option.*

#### Parameters

option	The <b>Socket</b> (p. 3607) options whose value is to be retrieved.
--------	---

#### Returns

*the value of the given socket option.*

#### Exceptions

IOException	if an I/O error occurs while performing this operation.
-------------	---

- virtual void **setOption** (int option, int value) throw ( decaf::io::IOException )

*Sets the specified option on the **Socket** (p. 3607) if supported.*

#### Parameters

option	The <b>Socket</b> (p. 3607) option to set.
value	The value of the socket option to apply to the socket.

#### Exceptions

IOException	if an I/O error occurs while performing this operation.
-------------	---

- int **read** (unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

*Reads the requested data from the Socket and write it into the passed in buffer.*

- void **write** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

*Writes the specified data in the passed in buffer to the Socket.*

## Protected Member Functions

- void **checkResult** (apr\_status\_t value) const throw ( decaf::net::SocketException )

### 6.801.1 Detailed Description

Platform-independent implementation of the socket interface.

## 6.801.2 Constructor & Destructor Documentation

6.801.2.1 `decaf::internal::net::tcp::TcpSocket::TcpSocket ( ) throw ( decaf::net::SocketException )`

Construct a non-connected socket.

### Exceptions

<i>SocketException</i>	thrown if an error occurs while creating the Socket.
------------------------	--

6.801.2.2 `virtual decaf::internal::net::tcp::TcpSocket::~~TcpSocket ( ) [virtual]`

Releases the socket handle but not gracefully shut down the connection.

## 6.801.3 Member Function Documentation

6.801.3.1 `virtual void decaf::internal::net::tcp::TcpSocket::accept ( SocketImpl * socket ) throw ( decaf::io::IOException ) [virtual]`

6.801.3.2 `virtual int decaf::internal::net::tcp::TcpSocket::available ( ) throw ( decaf::io::IOException ) [virtual]`

Gets the number of bytes that can be read from the **Socket** (p. 3607) without blocking.

### Returns

the number of bytes that can be read from the **Socket** (p. 3607) without blocking.

### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3638).

6.801.3.3 `virtual void decaf::internal::net::tcp::TcpSocket::bind ( const std::string & ipaddress, int port ) throw ( decaf::io::IOException ) [virtual]`

Binds this **Socket** (p. 3607) instance to the local ip address and port number given.

### Parameters

<i>ipaddress</i>	The address of local ip to bind to.
<i>port</i>	The port number on the host to bind to.

### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3638).

**6.801.3.4** `void decaf::internal::net::tcp::TcpSocket::checkResult ( apr_status_t value ) const  
throw ( decaf::net::SocketException )` [protected]

**6.801.3.5** `virtual void decaf::internal::net::tcp::TcpSocket::close ( ) throw ( decaf::io::IOException )` [virtual]

Closes the socket, terminating any blocked reads or writes.

### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3639).

**6.801.3.6** `virtual void decaf::internal::net::tcp::TcpSocket::connect ( const std::string & hostname, int port, int timeout ) throw ( decaf::io::IOException, decaf::net::SocketException, decaf::lang::exceptions::IllegalArgumentException )` [virtual]

Connects this socket to the given host and port.

### Parameters

<i>hostname</i>	The name of the host to connect to, or IP address.
<i>port</i>	The port number on the host to connect to.
<i>timeout</i>	Time in milliseconds to wait for a connection, 0 indicates forever.

### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
<i>SocketTimeoutException</i> (p. 3650)	if the connect call times out due to timeout being set.
<i>IllegalArgumentEx-ception</i>	if a parameter has an illegal value.

Implements **decaf::net::SocketImpl** (p. 3639).

**6.801.3.7** `virtual void decaf::internal::net::tcp::TcpSocket::create ( ) throw ( decaf::io::IOException )` [virtual]

Creates the underlying platform **Socket** (p. 3607) data structures which allows for **Socket** (p. 3607) options to be applied.

The created socket is in an unconnected state.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3640).

**6.801.3.8** `virtual decaf::io::InputStream* decaf::internal::net::tcp::TcpSocket::getInputStream ( ) throw ( decaf::io::IOException )` [virtual]

Gets the InputStream linked to this **Socket** (p. 3607).

**Returns**

an InputStream pointer owned by the **Socket** (p. 3607) object.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3640).

**6.801.3.9** `virtual std::string decaf::internal::net::tcp::TcpSocket::getLocalAddress ( ) const` [virtual]

Gets the value of the local Inet address the **Socket** (p. 3607) is bound to if bound, otherwise return the **InetAddress** (p. 2077) ANY value "0.0.0.0".

**Returns**

the local address bound to, or ANY.

Implements **decaf::net::SocketImpl** (p. 3641).

**6.801.3.10** `virtual int decaf::internal::net::tcp::TcpSocket::getOption ( int option ) const throw ( decaf::io::IOException )` [virtual]

Gets the specified **Socket** (p. 3607) option.

**Parameters**

<i>option</i>	The <b>Socket</b> (p. 3607) options whose value is to be retrieved.
---------------	---

**Returns**

the value of the given socket option.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3641).

**6.801.3.11** virtual **decaf::io::OutputStream\*** **decaf::internal::net::tcp::TcpSocket::getOutputStream** ( ) throw ( **decaf::io::IOException** ) [virtual]

Gets the OutputStream linked to this **Socket** (p. 3607).

#### Returns

an OutputStream pointer owned by the **Socket** (p. 3607) object.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3641).

**6.801.3.12** **SocketHandle** **decaf::internal::net::tcp::TcpSocket::getSocketHandle** ( ) [inline]

Gets the handle for the socket.

#### Returns

SocketHabler for this Socket, can be NULL

**6.801.3.13** **bool** **decaf::internal::net::tcp::TcpSocket::isClosed** ( ) const [inline]

#### Returns

true if the close method has been called on this Socket.

**6.801.3.14** **bool** **decaf::internal::net::tcp::TcpSocket::isConnected** ( ) const [inline]

#### Returns

true if the socketHandle is not in a disconnected state.

**6.801.3.15** virtual void **decaf::internal::net::tcp::TcpSocket::listen** ( int *backlog* ) throw ( **decaf::io::IOException** ) [virtual]

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

**Parameters**

<i>backlog</i>	The maximum length of the connection queue.
----------------	---

**Exceptions**

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3642).

**6.801.3.16** `int decaf::internal::net::tcp::TcpSocket::read ( unsigned char * buffer,  
int size, int offset, int length ) throw ( decaf::io::IOException,  
decaf::lang::exceptions::IndexOutOfBoundsException,  
decaf::lang::exceptions::NullPointerException )`

Reads the requested data from the Socket and write it into the passed in buffer.

**Parameters**

<i>buffer</i>	The buffer to read into
<i>size</i>	The size of the specified buffer
<i>offset</i>	The offset into the buffer where reading should start filling.
<i>length</i>	The number of bytes past offset to fill with data.

**Returns**

the actual number of bytes read or -1 if at EOF.

**Exceptions**

<i>IOException</i>	if an I/O error occurs during the read.
<i>NullPointerException</i>	if buffer is Null.
<i>IndexOutOfBoundsException</i>	if offset + length is greater than buffer size.

**6.801.3.17** `virtual void decaf::internal::net::tcp::TcpSocket::setOption ( int option, int value )  
throw ( decaf::io::IOException )` [virtual]

Sets the specified option on the **Socket** (p. 3607) if supported.

**Parameters**

<i>option</i>	The <b>Socket</b> (p. 3607) option to set.
<i>value</i>	The value of the socket option to apply to the socket.

**Exceptions**

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3643).

**6.801.3.18** virtual void decaf::internal::net::tcp::TcpSocket::shutdownInput ( ) throw ( decaf::io::IOException ) [virtual]

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 3643) on the socket, the stream will return EOF.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3643).

**6.801.3.19** virtual void decaf::internal::net::tcp::TcpSocket::shutdownOutput ( ) throw ( decaf::io::IOException ) [virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 3643) on the socket, the stream will throw an IOException.

#### Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 3643).

**6.801.3.20** void decaf::internal::net::tcp::TcpSocket::write ( const unsigned char \* *buffer*, int *size*, int *offset*, int *length* ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

Writes the specified data in the passed in buffer to the Socket.

#### Parameters

<i>buffer</i>	The buffer to write to the socket.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset into the buffer where the data to write starts at.
<i>length</i>	The number of bytes past offset to write.

#### Exceptions

<i>IOException</i>	if an I/O error occurs during the write.
--------------------	--

<i>NullPointerException</i>	if buffer is Null.
<i>IndexOutOfBoundsException</i>	if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/TcpSocket.h

## 6.802 decaf::internal::net::tcp::TcpSocketInputStream Class Reference

Input stream for performing reads on a socket.

```
#include <src/main/decaf/internal/net/tcp/TcpSocketInputStream.h>
```

Inheritance diagram for decaf::internal::net::tcp::TcpSocketInputStream:

### Public Member Functions

- **TcpSocketInputStream** (**TcpSocket** \*socket)

*Create a new InputStream to use for reading from the TCP/IP socket.*

- virtual ~**TcpSocketInputStream** ()

- virtual int **available** () const throw ( decaf::io::IOException )

*Indicates the number of bytes available.*

*The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.*

*The default implementation of this method returns zero.*

#### Returns

*the number of bytes available on this input stream.*

#### Exceptions

<b>IOException</b> (p. 2210)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual void **close** () throw ( decaf::io::IOException )

*Close - does nothing.*

- virtual long long **skip** (long long num) throw ( decaf::io::IOException, decaf::lang::exceptions::Unsupported )

*Not supported.*

## Protected Member Functions

- virtual int **doReadByte** () throw ( io::IOException )
- virtual int **doReadArrayBounded** (unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException )

### 6.802.1 Detailed Description

Input stream for performing reads on a socket. This class will only work properly for blocking sockets.

Since

1.0

### 6.802.2 Constructor & Destructor Documentation

#### 6.802.2.1 decaf::internal::net::tcp::TcpSocketInputStream::TcpSocketInputStream ( TcpSocket \* *socket* )

Create a new InputStream to use for reading from the TCP/IP socket.

#### Parameters

<i>socket</i>	The parent SocketImpl for this stream.
---------------	--

#### 6.802.2.2 virtual decaf::internal::net::tcp::TcpSocketInputStream::~~TcpSocketInputStream ( ) [virtual]

### 6.802.3 Member Function Documentation

#### 6.802.3.1 virtual int decaf::internal::net::tcp::TcpSocketInputStream::available ( ) const throw ( decaf::io::IOException ) [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

**Returns**

the number of bytes available on this input stream.

**Exceptions**

<b><i>IOException</i></b> (p. 2210)	if an I/O error occurs.
--	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 2107).

**6.802.3.2** `virtual void decaf::internal::net::tcp::TcpSocketInputStream::close ( ) throw ( decaf::io::IOException ) [virtual]`

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 2105) freeing any resources that might have been aquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::InputStream** (p. 2108).

**6.802.3.3** `virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadArrayBounded ( unsigned char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException ) [protected, virtual]`

Reimplemented from **decaf::io::InputStream** (p. 2108).

**6.802.3.4** `virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadByte ( ) throw ( io::IOException ) [protected, virtual]`

Implements **decaf::io::InputStream** (p. 2109).

**6.802.3.5** `virtual long long decaf::internal::net::tcp::TcpSocketInputStream::skip ( long long num ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]`

Not supported.

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions;

## 6.803 decaf::internal::net::tcp::TcpSocketOutputStream Class Reference 3867

reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The `skip` method of **InputStream** (p. 2105) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

### Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

### Returns

total bytes skipped

### Exceptions

<b>IOException</b> (p. 2210)	if an I/O error occurs.
<b>UnsupportedOperationException</b>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 2113).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/tcp/TcpSocketInputStream.h`

## 6.803 decaf::internal::net::tcp::TcpSocketOutputStream Class Reference

Output stream for performing write operations on a socket.

```
#include <src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h>
```

Inheritance diagram for `decaf::internal::net::tcp::TcpSocketOutputStream`:

### Public Member Functions

- **TcpSocketOutputStream** (**TcpSocket** \*socket)  
*Create a new instance of a Socket OutputStream class.*
- virtual **~TcpSocketOutputStream** ()
- virtual void **close** () throw ( `decaf::io::IOException` )  
*Closes this object and deallocates the appropriate resources.  
The object is generally no longer usable after calling close.*  
**Exceptions**

<b>IOException</b> (p. 2210)	<i>if an error occurs while closing.</i>
------------------------------	--

*The default implementation of this method does nothing.*

## Protected Member Functions

- virtual void **doWriteByte** (unsigned char c) throw ( decaf::io::IOException )
- virtual void **doWriteArrayBounded** (const unsigned char \*buffer, int size, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )

### 6.803.1 Detailed Description

Output stream for performing write operations on a socket.

Since

1.0

### 6.803.2 Constructor & Destructor Documentation

6.803.2.1 **decaf::internal::net::tcp::TcpSocketOutputStream::TcpSocketOutputStream ( TcpSocket \* socket )**

Create a new instance of a Socket OutputStream class.

Parameters

<i>socket</i>	The socket to use to write out the data.
---------------	--

6.803.2.2 **virtual decaf::internal::net::tcp::TcpSocketOutputStream::~~TcpSocketOutputStream ( )** [virtual]

### 6.803.3 Member Function Documentation

6.803.3.1 **virtual void decaf::internal::net::tcp::TcpSocketOutputStream::close ( )** throw ( decaf::io::IOException ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<b>IOException</b> (p. 2210)	if an error occurs while closing.
---------------------------------	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2993).

```
6.803.3.2 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::doWriteArrayBounded
( const unsigned char * buffer, int size, int offset, int length ) throw (
  decaf::io::IOException, decaf::lang::exceptions::NullPointerException,
  decaf::lang::exceptions::IndexOutOfBoundsException )
[protected, virtual]
```

Reimplemented from **decaf::io::OutputStream** (p. 2994).

```
6.803.3.3 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::doWriteByte ( unsigned
char c ) throw ( decaf::io::IOException ) [protected, virtual]
```

Implements **decaf::io::OutputStream** (p. 2994).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h

## 6.804 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 2213).

```
#include <src/main/activemq/transport/tcp/TcpTransport.h>
```

Inheritance diagram for activemq::transport::tcp::TcpTransport:

### Public Member Functions

- **TcpTransport** (const **Pointer**< **Transport** > &next)  
*Creates a new instance of a **TcpTransport** (p. 3865), the transport is left unconnected and is in a unusable state until the connect method is called.*
- virtual ~**TcpTransport** ()
- void **connect** (const **decaf::net::URI** &uri, const **decaf::util::Properties** &properties)  
*Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.*
- virtual void **close** () throw ( decaf::io::IOException )  
*Delegates to the superclass and then closes the socket.*

*Is this **Transport** (p. 3996) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

*Is the **Transport** (p. 3996) Connected to its Broker.*

- virtual bool **isClosed** () const

*Has the **Transport** (p. 3996) been shutdown and no longer usable.*

## Protected Member Functions

- virtual **decaf::net::Socket \* createSocket** ()

*Create an unconnected Socket instance to be used by the transport to communicate with the broker.*

- virtual void **configureSocket** (**decaf::net::Socket \*socket**, const **decaf::util::Properties &properties**)

*Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.*

## 6.804.1 Detailed Description

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 2213). The lower level transport should take care of managing stream reads and writes.

## 6.804.2 Constructor & Destructor Documentation

### 6.804.2.1 **activemq::transport::tcp::TcpTransport::TcpTransport ( const Pointer< Transport > & next )**

Creates a new instance of a **TcpTransport** (p. 3865), the transport is left unconnected and is in a unusable state until the connect method is called.

#### Parameters

<i>next</i>	The next transport in the chain
-------------	---------------------------------

6.804.2.2 virtual `activemq::transport::tcp::TcpTransport::~~TcpTransport ( )` [virtual]

### 6.804.3 Member Function Documentation

6.804.3.1 virtual void `activemq::transport::tcp::TcpTransport::close ( )` throw (`decaf::io::IOException`) [virtual]

Delegates to the superclass and then closes the socket.

#### Exceptions

<i>IOException</i>	if errors occur.
--------------------	------------------

Reimplemented from `activemq::transport::TransportFilter` (p. 4007).

6.804.3.2 virtual void `activemq::transport::tcp::TcpTransport::configureSocket ( decaf::net::Socket * socket, const decaf::util::Properties & properties )` [protected, virtual]

Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.

#### Parameters

<i>socket</i>	The Socket instance to configure using options from the given Properties.
---------------	---

#### Exceptions

<i>NullPointerException</i>	if the Socket instance is null.
<i>IllegalArgumentException</i>	if the socket instance is not handled by the class.
<i>SocketException</i>	if there is an error while setting one of the Socket options.

6.804.3.3 void `activemq::transport::tcp::TcpTransport::connect ( const decaf::net::URI & uri, const decaf::util::Properties & properties )`

Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.

The Socket is configured using parameters in the properties that are passed to this method.

#### Parameters

<i>uri</i>	The URI that the <b>Transport</b> (p. 3996) is to connect to once initialized.
------------	--

<i>properties</i>	The Properties that have been parsed from the URI or from configuration files.
-------------------	--

**6.804.3.4** `virtual decaf::net::Socket* activemq::transport::tcp::TcpTransport::createSocket ( )` [protected, virtual]

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

#### Returns

a newly created unconnected Socket instance.

#### Exceptions

<i>IOException</i>	if there is an error while creating the unconnected Socket.
--------------------	---

Reimplemented in `activemq::transport::tcp::SslTransport` (p. 3683).

**6.804.3.5** `virtual bool activemq::transport::tcp::TcpTransport::isClosed ( )` const [inline, virtual]

Has the **Transport** (p. 3996) been shutdown and no longer usable.

#### Returns

true if the **Transport** (p. 3996)

Reimplemented from `activemq::transport::TransportFilter` (p. 4008).

**6.804.3.6** `virtual bool activemq::transport::tcp::TcpTransport::isConnected ( )` const [inline, virtual]

Is the **Transport** (p. 3996) Connected to its Broker.

#### Returns

true if a connection has been made.

Reimplemented from `activemq::transport::TransportFilter` (p. 4008).

**6.804.3.7** `virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant ( )` const [inline, virtual]

Is this **Transport** (p. 3996) fault tolerant, meaning that it will reconnect to a broker on disconnect.

**Returns**

true if the **Transport** (p. 3996) is fault tolerant.

Reimplemented from `activemq::transport::TransportFilter` (p. 4009).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/tcp/TcpTransport.h`

**6.805 `activemq::transport::tcp::TcpTransportFactory` Class Reference**

Factory Responsible for creating the **TcpTransport** (p. 3865).

```
#include <src/main/activemq/transport/tcp/TcpTransportFactory.h>
```

Inheritance diagram for `activemq::transport::tcp::TcpTransportFactory`:

**Public Member Functions**

- virtual `~TcpTransportFactory()`
- virtual `Pointer< Transport > create` (const `decaf::net::URI` &location) throw ( exceptions::ActiveMQException )  
*Creates a fully configured **Transport** (p. 3996) instance which could be a chain of filters and transports.*
- virtual `Pointer< Transport > createComposite` (const `decaf::net::URI` &location) throw ( exceptions::ActiveMQException )  
*Creates a slimed down **Transport** (p. 3996) instance which can be used in composite transport instances.*

**Protected Member Functions**

- virtual `Pointer< Transport > doCreateComposite` (const `decaf::net::URI` &location, const `Pointer< wireformat::WireFormat >` &wireFormat, const `decaf::util::Properties` &properties) throw ( exceptions::ActiveMQException )  
*Creates a slimed down **Transport** (p. 3996) instance which can be used in composite transport instances.*

**6.805.1 Detailed Description**

Factory Responsible for creating the **TcpTransport** (p. 3865).

## 6.805.2 Constructor & Destructor Documentation

6.805.2.1 `virtual activemq::transport::tcp::TcpTransportFactory::~~TcpTransportFactory ( )`  
`[inline, virtual]`

## 6.805.3 Member Function Documentation

6.805.3.1 `virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create ( const decaf::net::URI & location ) throw ( exceptions::ActiveMQException )`  
`[virtual]`

Creates a fully configured **Transport** (p.3996) instance which could be a chain of filters and transports.

### Parameters

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

### Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implements `activemq::transport::TransportFactory` (p.4003).

6.805.3.2 `virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite ( const decaf::net::URI & location ) throw ( exceptions::ActiveMQException )`  
`[virtual]`

Creates a slimed down **Transport** (p.3996) instance which can be used in composite transport instances.

### Parameters

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

### Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implements `activemq::transport::TransportFactory` (p.4004).

```
6.805.3.3 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::doCreateComposite
( const decaf::net::URI & location, const Pointer<
wireformat::WireFormat > & wireFormat, const decaf::util::Properties &
properties ) throw ( exceptions::ActiveMQException ) [protected,
virtual]
```

Creates a slimmed down **Transport** (p. 3996) instance which can be used in composite transport instances.

#### Parameters

<i>location</i>	- URI location to connect to.
<i>wireFormat</i>	- the assigned WireFormat for the new <b>Transport</b> (p. 3996).
<i>properties</i>	- Properties to apply to the transport.

#### Returns

new Pointer to a **TcpTransport** (p. 3865).

#### Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Reimplemented in **activemq::transport::tcp::SslTransportFactory** (p. 3685).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**TcpTransportFactory.h**

## 6.806 cms::TemporaryQueue Class Reference

Defines a Temporary **Queue** (p. 3238) based **Destination** (p. 1776).

```
#include <src/main/cms/TemporaryQueue.h>
```

Inheritance diagram for cms::TemporaryQueue:

#### Public Member Functions

- virtual **~TemporaryQueue** ()
- virtual std::string **getQueueName** () const =0 throw ( CMSEException )  
*Gets the name of this queue.*
- virtual void **destroy** ()=0 throw ( CMSEException )  
*Destroy's the Temporary **Destination** (p. 1776) at the Provider.*

### 6.806.1 Detailed Description

Defines a Temporary **Queue** (p. 3238) based **Destination** (p. 1776). A **TemporaryQueue** (p. 3871) is a special type of **Queue** (p. 3238) **Destination** (p. 1776) that can only be consumed from the **Connection** (p. 1296) which created it. TemporaryQueues are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryQueue** (p. 3871) is guaranteed to exist at the Provider only for the life-time of the **Connection** (p. 1296) that created it.

#### Since

1.0

### 6.806.2 Constructor & Destructor Documentation

6.806.2.1 `virtual cms::TemporaryQueue::~TemporaryQueue ( ) [inline, virtual]`

### 6.806.3 Member Function Documentation

6.806.3.1 `virtual void cms::TemporaryQueue::destroy ( ) throw ( CMSException ) [pure virtual]`

Destroy's the Temporary **Destination** (p. 1776) at the Provider.

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if an internal error occurs.
---	--------------------------------

Implemented in `activemq::commands::ActiveMQTempQueue` (p. 609).

6.806.3.2 `virtual std::string cms::TemporaryQueue::getQueueName ( ) const throw ( CMSException ) [pure virtual]`

Gets the name of this queue.

#### Returns

The queue name.

#### Exceptions

<b><i>CMSException</i></b> (p. 1190)	- if an internal error occurs.
---	--------------------------------

Implemented in `activemq::commands::ActiveMQTempQueue` (p. 610).

The documentation for this class was generated from the following file:

- src/main/cms/TemporaryQueue.h

## 6.807 cms::TemporaryTopic Class Reference

Defines a Temporary **Topic** (p. 3930) based **Destination** (p. 1776).

```
#include <src/main/cms/TemporaryTopic.h>
```

Inheritance diagram for cms::TemporaryTopic:

### Public Member Functions

- virtual **~TemporaryTopic** ()
- virtual std::string **getTopicName** () const =0 throw ( CMSEException )  
*Gets the name of this topic.*
- virtual void **destroy** ()=0 throw ( CMSEException )  
*Destroy's the Temporary **Destination** (p. 1776) at the Provider.*

### 6.807.1 Detailed Description

Defines a Temporary **Topic** (p. 3930) based **Destination** (p. 1776). A **Temporary-Topic** (p. 3873) is a special type of **Topic** (p. 3930) **Destination** (p. 1776) that can only be consumed from the **Connection** (p. 1296) which created it. TemporaryTopics are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryTopic** (p. 3873) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 1296) that created it.

Since

1.0

### 6.807.2 Constructor & Destructor Documentation

6.807.2.1 virtual cms::TemporaryTopic::~TemporaryTopic ( ) [inline, virtual]

### 6.807.3 Member Function Documentation

6.807.3.1 virtual void cms::TemporaryTopic::destroy ( ) throw ( CMSEException ) [pure virtual]

Destroy's the Temporary **Destination** (p. 1776) at the Provider.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)
--

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 639).

**6.807.3.2** `virtual std::string cms::TemporaryTopic::getTopicName ( ) const throw ( CMSEException ) [pure virtual]`

Gets the name of this topic.

**Returns**

The topic name.

**Exceptions**

<b><i>CMSEException</i></b> (p. 1190)	- if an internal error occurs.
--	--------------------------------

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 640).

The documentation for this class was generated from the following file:

- `src/main/cms/TemporaryTopic.h`

**6.808 cms::TextMessage Class Reference**

Interface for a text message.

```
#include <src/main/cms/TextMessage.h>
```

Inheritance diagram for `cms::TextMessage`:

**Public Member Functions**

- `virtual ~TextMessage ()`
- `virtual std::string getText () const =0 throw ( cms::CMSEException )`  
*Gets the message character buffer.*
- `virtual void setText (const char *msg)=0 throw ( cms::MessageNotWriteableException, cms::CMSEException )`  
*Sets the message contents, does not take ownership of the passed char\*, but copies it instead.*

- virtual void **setText** (const std::string &msg)=0 throw ( cms::MessageNotWriteableException, cms::CMSEException )

*Sets the message contents.*

### 6.808.1 Detailed Description

Interface for a text message. A **TextMessage** (p. 3874) can contain any Text based payload such as an XML Document or other Text based document.

Like all Messages, a **TextMessage** (p. 3874) is received in Read-Only mode, any attempt to write to the **Message** (p. 2614) will result in a MessageNotWritableException being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

#### Since

1.0

### 6.808.2 Constructor & Destructor Documentation

6.808.2.1 virtual cms::TextMessage::~TextMessage ( ) [inline, virtual]

### 6.808.3 Member Function Documentation

6.808.3.1 virtual std::string cms::TextMessage::getText ( ) const throw ( cms::CMSEException ) [pure virtual]

Gets the message character buffer.

#### Returns

The message character buffer.

#### Exceptions

<b>CMSEException</b> (p. 1190)	- if an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 670).

6.808.3.2 virtual void cms::TextMessage::setText ( const std::string & msg ) throw ( cms::MessageNotWriteableException, cms::CMSEException ) [pure virtual]

Sets the message contents.

**Parameters**

<i>msg</i>	The message buffer.
------------	---------------------

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if an internal error occurs.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 670).

**6.808.3.3** `virtual void cms::TextMessage::setText ( const char * msg ) throw ( cms::MessageNotWriteableException, cms::CMSException )` [pure virtual]

Sets the message contents, does not take ownership of the passed char\*, but copies it instead.

**Parameters**

<i>msg</i>	The message buffer.
------------	---------------------

**Exceptions**

<b><i>CMSException</i></b> (p. 1190)	- if an internal error occurs.
<b><i>MessageNotWriteableException</i></b> (p. 2808)	- if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 671).

The documentation for this class was generated from the following file:

- `src/main/cms/TextMessage.h`

## 6.809 decaf::lang::Thread Class Reference

A **Thread** (p. 3876) is a concurrent unit of execution.

```
#include <src/main/decaf/lang/Thread.h>
```

Inheritance diagram for decaf::lang::Thread:

## Data Structures

- class **UncaughtExceptionHandler**

*Interface for handlers invoked when a **Thread** (p. 3876) abruptly terminates due to an uncaught exception.*

## Public Types

- enum **State** {  
NEW = 0, RUNNABLE = 1, BLOCKED = 2, WAITING = 3,  
TIMED\_WAITING = 4, SLEEPING = 5, TERMINATED = 6 }

*Represents the various states that the **Thread** (p. 3876) can be in during its lifetime.*

## Public Member Functions

- **Thread** ()  
*Constructs a new **Thread** (p. 3876).*
- **Thread** (**Runnable** \*task)  
*Constructs a new **Thread** (p. 3876) with the given target **Runnable** (p. 3418) task.*
- **Thread** (const std::string &name)  
*Constructs a new **Thread** (p. 3876) with the given name.*
- **Thread** (**Runnable** \*task, const std::string &name)  
*Constructs a new **Thread** (p. 3876) with the given target **Runnable** (p. 3418) task and name.*

*Default implementation of the run method - does nothing.*
- std::string **getName** () const  
*Returns the Thread's assigned name.*
- void **setName** (const std::string &name)  
*Sets the name of the **Thread** (p. 3876) to the new Name given by the argument name*
- int **getPriority** () const  
*Gets the currently set priority for this **Thread** (p. 3876).*
- void **setPriority** (int value) throw ( decaf::lang::exceptions::IllegalArgumentException )  
*Sets the current Thread's priority to the newly specified value.*
- const **UncaughtExceptionHandler** \* **getUncaughtExceptionHandler** () const  
*Set the handler invoked when this thread abruptly terminates due to an uncaught exception.*
- void **setUncaughtExceptionHandler** (**UncaughtExceptionHandler** \*handler)  
*Set the handler invoked when this thread abruptly terminates due to an uncaught exception.*
- std::string **toString** () const  
*Returns a string that describes the **Thread** (p. 3876).*
- bool **isAlive** () const  
*Returns true if the **Thread** (p. 3876) is alive, meaning it has been started and has not yet died.*
- **Thread::State** **getState** () const  
*Returns the currently set State of this **Thread** (p. 3876).*

### Static Public Member Functions

- static void **sleep** (long long millisecs) throw ( lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException )  
*Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.*
- static void **sleep** (long long millisecs, unsigned int nanos) throw ( lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException )

*Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.*

- static void **yield** ()

*Causes the currently executing thread object to temporarily pause and allow other threads to execute.*

- static long long **getId** ()

*Obtains the **Thread** (p. 3876) Id of the current thread.*

- static **Thread** \* **currentThread** ()

*Returns a pointer to the currently executing thread object.*

### Static Public Attributes

- static const int **MIN\_PRIORITY** = 1

*The minimum priority that a thread can have.*

- static const int **NORM\_PRIORITY** = 5

*The default priority that a thread is given at create time.*

- static const int **MAX\_PRIORITY** = 10

*The maximum priority that a thread can have.*

### Friends

- class **decaf::util::concurrent::locks::LockSupport**
- class **decaf::lang::Runtime**

#### 6.809.1 Detailed Description

A **Thread** (p. 3876) is a concurrent unit of execution. It has its own call stack for methods being invoked, their arguments and local variables. Each process has at least one main **Thread** (p. 3876) running when it is started; typically, there are several others for housekeeping. The application might decide to launch additional Threads for specific purposes.

Threads in the same process interact and synchronize by the use of shared objects and monitors associated with these objects.

There are basically two main ways of having a **Thread** (p. 3876) execute application code. One is providing a new class that extends **Thread** (p. 3876) and overriding its **run()** (p. 3884) method. The other is providing a new **Thread** (p. 3876) instance with a **Runnable** (p. 3418) object during its creation. In both cases, the **start()** (p. 3885) method must be called to actually execute the new **Thread** (p. 3876).

Each **Thread** (p. 3876) has an integer priority that basically determines the amount of CPU time the **Thread** (p. 3876) gets. It can be set using the **setPriority(int)** (p. 3884) method. A **Thread** (p. 3876) can also be made a daemon, which makes it run in the background. The latter also affects VM termination behavior: the VM does not terminate automatically as long as there are non-daemon threads running.

**decaf.lang.ThreadGroup** (p. 3888)

Since

1.0

## 6.809.2 Member Enumeration Documentation

### 6.809.2.1 enum decaf::lang::Thread::State

Represents the various states that the **Thread** (p. 3876) can be in during its lifetime.

Enumerator:

**NEW** Before a **Thread** (p. 3876) is started it exists in this State.

**RUNNABLE** While a **Thread** (p. 3876) is running and is not blocked it is in this State.

**BLOCKED** A **Thread** (p. 3876) that is waiting to acquire a lock is in this state.

**WAITING** A **Thread** (p. 3876) that is waiting for another **Thread** (p. 3876) to perform an action is in this state.

**TIMED\_WAITING** A **Thread** (p. 3876) that is waiting for another **Thread** (p. 3876) to perform an action up to a specified time interval is in this state.

**SLEEPING** A **Thread** (p. 3876) that is blocked in a Sleep call is in this state.

**TERMINATED** A **Thread** (p. 3876) whose run method has exited is in this state.

## 6.809.3 Constructor & Destructor Documentation

### 6.809.3.1 decaf::lang::Thread::Thread ( )

Constructs a new **Thread** (p. 3876).

This constructor has the same effect as `Thread( NULL, NULL, GIVEN_NAME )`, where `GIVEN_NAME` is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

### 6.809.3.2 decaf::lang::Thread::Thread ( Runnable \* task )

Constructs a new **Thread** (p. 3876) with the given target **Runnable** (p. 3418) task.

This constructor has the same effect as `Thread( NULL, task, GIVEN_NAME )`, where `GIVEN_NAME` is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

#### Parameters

<i>task</i>	the <b>Runnable</b> (p. 3418) that this thread manages, if the task is <code>NULL</code> the Thread's run method is used instead.
-------------	---

#### 6.809.3.3 decaf::lang::Thread::Thread ( const std::string & name )

Constructs a new **Thread** (p. 3876) with the given name.

This constructor has the same effect as `Thread( NULL, NULL, GIVEN_NAME )`, where `GIVEN_NAME` is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

#### Parameters

<i>name</i>	the name to assign to this <b>Thread</b> (p. 3876).
-------------	---

#### 6.809.3.4 decaf::lang::Thread::Thread ( Runnable \* task, const std::string & name )

Constructs a new **Thread** (p. 3876) with the given target **Runnable** (p. 3418) task and name.

This constructor has the same effect as `Thread( NULL, task, GIVEN_NAME )`, where `GIVEN_NAME` is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

#### Parameters

<i>task</i>	the <b>Runnable</b> (p. 3418) that this thread manages, if the task is <code>NULL</code> the Thread's run method is used instead.
<i>name</i>	the name to assign to this <b>Thread</b> (p. 3876).

#### 6.809.3.5 virtual decaf::lang::Thread::~~Thread ( ) [virtual]

### 6.809.4 Member Function Documentation

#### 6.809.4.1 static Thread\* decaf::lang::Thread::currentThread ( ) [static]

Returns a pointer to the currently executing thread object.

#### Returns

**Pointer** (p. 3032) to the **Thread** (p. 3876) object representing the currently running **Thread** (p. 3876).

**6.809.4.2 static long long decaf::lang::Thread::getId ( ) [static]**

Obtains the **Thread** (p. 3876) Id of the current thread.

**Returns**

**Thread** (p. 3876) Id

**6.809.4.3 std::string decaf::lang::Thread::getName ( ) const**

Returns the **Thread**'s assigned name.

**Returns**

the Name of the **Thread** (p. 3876).

**6.809.4.4 int decaf::lang::Thread::getPriority ( ) const**

Gets the currently set priority for this **Thread** (p. 3876).

**Returns**

an int value representing the **Thread**'s current priority.

**6.809.4.5 Thread::State decaf::lang::Thread::getState ( ) const**

Returns the currently set State of this **Thread** (p. 3876).

**Returns**

the **Thread**'s current state.

**6.809.4.6 const UncaughtExceptionHandler\* decaf::lang::Thread::getUncaughtExceptionHandler ( ) const**

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

**Returns**

a pointer to the set **UncaughtExceptionHandler** (p. 4018).

**6.809.4.7** bool decaf::lang::Thread::isAlive ( ) const

Returns true if the **Thread** (p. 3876) is alive, meaning it has been started and has not yet died.

**Returns**

true if the thread is alive.

**6.809.4.8** virtual void decaf::lang::Thread::join ( long long *millisecs*, unsigned int *nanos* ) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::InterruptedException ) [virtual]

Forces the Current **Thread** (p. 3876) to wait until the thread exits.

**Parameters**

<i>millisecs</i>	the time in Milliseconds before the thread resumes
<i>nanos</i>	0-999999 extra nanoseconds to sleep.

**Exceptions**

<i>IllegalArgumentException</i>	if the nanoseconds parameter is out of range or the milliseconds paramter is negative.
<i>InterruptedException</i>	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

**6.809.4.9** virtual void decaf::lang::Thread::join ( ) throw ( decaf::lang::exceptions::InterruptedException ) [virtual]

Forces the Current **Thread** (p. 3876) to wait until the thread exits.

**Exceptions**

<i>InterruptedException</i>	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.
-----------------------------	--

**6.809.4.10** virtual void decaf::lang::Thread::join ( long long *millisecs* ) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::InterruptedException ) [virtual]

Forces the Current **Thread** (p. 3876) to wait until the thread exits.

**Parameters**

<i>millisecs</i>	the time in Milliseconds before the thread resumes
------------------	--

**Exceptions**

<i>IllegalArgumentException</i>	if the milliseconds parameter is negative.
<i>InterruptedException</i>	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

**6.809.4.11 virtual void decaf::lang::Thread::run ( ) [virtual]**

Default implementation of the run method - does nothing.

Implements **decaf::lang::Runnable** (p. 3419).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 2193), and **decaf::util::concurrent::PooledThread** (p. 3057).

**6.809.4.12 void decaf::lang::Thread::setName ( const std::string & name )**

Sets the name of the **Thread** (p. 3876) to the new Name given by the argument *name* name the new name of the **Thread** (p. 3876).

**6.809.4.13 void decaf::lang::Thread::setPriority ( int value ) throw ( decaf::lang::exceptions::IllegalArgumentException )**

Sets the current Thread's priority to the newly specified value.

The given value must be within the range **Thread::MIN\_PRIORITY** (p. 3886) and **Thread::MAX\_PRIORITY** (p. 3886).

**Parameters**

<i>value</i>	the new priority value to assign to this <b>Thread</b> (p. 3876).
--------------	---

**Exceptions**

<i>IllegalArgumentException</i>	if the value is out of range.
---------------------------------	-------------------------------

**6.809.4.14 void decaf::lang::Thread::setUncaughtExceptionHandler ( UncaughtExceptionHandler \* handler )**

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

**Parameters**

<i>handler</i>	the UncaughtExceptionHandler to invoke when the <b>Thread</b> (p. 3876) terminates due to an uncaught exception.
----------------	--

**6.809.4.15** static void decaf::lang::Thread::sleep ( long long *millisecs*, unsigned int *nanos* ) throw ( lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException ) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

#### Parameters

<i>millisecs</i>	time in milliseconds to halt execution.
<i>nanos</i>	0-999999 extra nanoseconds to sleep.

#### Exceptions

<i>IllegalArgumentException</i>	if the nanoseconds parameter is out of range or the milliseconds parameter is negative.
<i>InterruptedException</i>	if the <b>Thread</b> (p. 3876) was interrupted while sleeping.

**6.809.4.16** static void decaf::lang::Thread::sleep ( long long *millisecs* ) throw ( lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException ) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

#### Parameters

<i>millisecs</i>	time in milliseconds to halt execution.
------------------	---

#### Exceptions

<i>IllegalArgumentException</i>	if the milliseconds parameter is negative.
<i>InterruptedException</i>	if the <b>Thread</b> (p. 3876) was interrupted while sleeping.

**6.809.4.17** virtual void decaf::lang::Thread::start ( ) throw ( decaf::lang::exceptions::IllegalThreadStateException, decaf::lang::exceptions::RuntimeException ) [virtual]

Creates a system thread and starts it in a joinable mode.

Upon creation, the **run()** (p. 3884) method of either this object or the provided **Runnable** (p. 3418) object will be invoked in the context of this thread.

**Exceptions**

<i>IllegalThreadStateException</i>	if the thread has already been started.
<i>RuntimeException</i>	if the <b>Thread</b> (p. 3876) cannot be created for some reason.

**6.809.4.18** `std::string decaf::lang::Thread::toString ( ) const`

Returns a string that describes the **Thread** (p. 3876).

**Returns**

string describing the **Thread** (p. 3876).

**6.809.4.19** `static void decaf::lang::Thread::yield ( ) [static]`

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

**6.809.5 Friends And Related Function Documentation****6.809.5.1** `friend class decaf::lang::Runtime [friend]`**6.809.5.2** `friend class decaf::util::concurrent::locks::LockSupport [friend]`**6.809.6 Field Documentation****6.809.6.1** `const int decaf::lang::Thread::MAX_PRIORITY = 10 [static]`

The maximum priority that a thread can have.

**6.809.6.2** `const int decaf::lang::Thread::MIN_PRIORITY = 1 [static]`

The minimum priority that a thread can have.

**6.809.6.3** `const int decaf::lang::Thread::NORM_PRIORITY = 5 [static]`

The default priority that a thread is given at create time.

## 6.810 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p. 3887)

```
#include <src/main/decaf/util/concurrent/ThreadFactory.h>
```

### Public Member Functions

- virtual **~ThreadFactory** ()
- virtual **decaf::lang::Thread \* newThread** (decaf::lang::Runnable \*r)=0  
*Constructs a new Thread.*

#### 6.810.1 Detailed Description

public interface **ThreadFactory** (p. 3887) An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

```
class SimpleThreadFactory : public ThreadFactory (p. 3887) { public: Thread* newThread(
Runnable* r ) { return new Thread(r); } }
```

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since

1.0

#### 6.810.2 Constructor & Destructor Documentation

6.810.2.1 virtual decaf::util::concurrent::ThreadFactory::~~ThreadFactory ( ) [inline, virtual]

#### 6.810.3 Member Function Documentation

6.810.3.1 virtual decaf::lang::Thread\* decaf::util::concurrent::ThreadFactory::newThread ( decaf::lang::Runnable \* r ) [pure virtual]

Constructs a new Thread.

Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

#### Parameters

<i>r</i>	A pointer to a Runnable instance to be executed by new Thread instance returned.
----------	--

**Returns**

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

The documentation for this class was generated from the following file:

*Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.*
- virtual void **onTaskStarted** (PooledThread \*thread)  
*Called by a pooled thread when it is about to begin executing a new task.*
- virtual void **onTaskCompleted** (PooledThread \*thread)

*Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.*

- virtual void **onTaskException** (**PooledThread** \*thread, **lang::Exception** &ex)

*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 3056) is now no longer running.*

### Static Public Member Functions

- static **ThreadPool** \* **getInstance** ()

*Return the one and only Thread Pool instance.*

### Static Public Attributes

- static const size\_t **DEFAULT\_MAX\_POOL\_SIZE** = 10
- static const size\_t **DEFAULT\_MAX\_BLOCK\_SIZE** = 3

#### 6.812.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks. The Thread Pool has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the `Runnable` interface and one of the worker threads will be executing it in its thread context.

## 6.812.2 Member Typedef Documentation

6.812.2.1 `typedef std::pair<lang::Runnable*, TaskListener*>`  
`decaf::util::concurrent::ThreadPool::Task`

## 6.812.3 Constructor & Destructor Documentation

6.812.3.1 `decaf::util::concurrent::ThreadPool::ThreadPool ( )`

6.812.3.2 `virtual decaf::util::concurrent::ThreadPool::~~ThreadPool ( )` `[virtual]`

## 6.812.4 Member Function Documentation

6.812.4.1 `virtual Task decaf::util::concurrent::ThreadPool::deQueueTask ( )` `throw ( lang::Exception )` `[virtual]`

DeQueue a task to be completed by one of the Pooled Threads.

A caller of this method will block until there is something in the tasks queue, therefore care must be taken when calling this function. Normally clients of **ThreadPool** (p. 3888) don't use this, only the **PooledThread** (p. 3056) objects owned by this **ThreadPool** (p. 3888).

### Returns

object that derives from Runnable

### Exceptions

<i>ActiveMQException</i>	
--------------------------	--

6.812.4.2 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBacklog ( )` `const`  
`[inline, virtual]`

Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.

### Returns

number of outstanding tasks.

6.812.4.3 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBlockSize ( )` `const`  
`[inline, virtual]`

Gets the Max number of threads that can be allocated at a time when new threads are needed.

### Returns

max Thread Block Size

**6.812.4.4** `virtual std::size_t decaf::util::concurrent::ThreadPool::getFreeThreadCount ( ) const`  
[inline, virtual]

Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.

This value could change immediately after calling as Threads could finish right after and be available again. This is informational only.

#### Returns

total free threads

**6.812.4.5** `static ThreadPool* decaf::util::concurrent::ThreadPool::getInstance ( )`  
[static]

Return the one and only Thread Pool instance.

#### Returns

The Thread Pool Pointer

**6.812.4.6** `virtual std::size_t decaf::util::concurrent::ThreadPool::getMaxThreads ( ) const`  
[inline, virtual]

Get the Max Number of Threads this Pool can contain.

#### Returns

max size

**6.812.4.7** `virtual std::size_t decaf::util::concurrent::ThreadPool::getPoolSize ( ) const`  
[inline, virtual]

Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.

#### Returns

integer number of threads in existence.

**6.812.4.8** `virtual void decaf::util::concurrent::ThreadPool::onTaskCompleted ( PooledThread * thread )` [virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

#### Parameters

<i>thread</i>	Pointer the the Pooled Thread that is making this call.
---------------	---

Implements **decaf::util::concurrent::PooledThreadListener** (p. 3059).

**6.812.4.9** `virtual void decaf::util::concurrent::ThreadPool::onTaskException ( PooledThread * thread, lang::Exception & ex )` [virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 3056) is now no longer running.

#### Parameters

<i>thread</i>	Pointer to the Pooled Thread that is making this call
<i>ex</i>	The Exception that occurred.

Implements **decaf::util::concurrent::PooledThreadListener** (p. 3059).

**6.812.4.10** `virtual void decaf::util::concurrent::ThreadPool::onTaskStarted ( PooledThread * thread )` [virtual]

Called by a pooled thread when it is about to begin executing a new task.

This will decrement the available threads counter so that this object knows when there are no more free threads and must create new ones.

#### Parameters

<i>thread</i>	Pointer to the Pooled Thread that is making this call
---------------	---

Implements **decaf::util::concurrent::PooledThreadListener** (p. 3059).

**6.812.4.11** `virtual void decaf::util::concurrent::ThreadPool::queueTask ( Task task ) throw ( lang::Exception )` [virtual]

**Queue** (p. 3239) a task to be completed by one of the Pooled Threads.

tasks are serviced as soon as a **PooledThread** (p. 3056) is available to run it.

#### Parameters

<i>task</i>	object that derives from Runnable
-------------	-----------------------------------

#### Exceptions

<i>ActiveMQException</i>	
--------------------------	--

**6.812.4.12** `virtual void decaf::util::concurrent::ThreadPool::reserve ( std::size_t size )`  
`[virtual]`

Ensures that there is at least the specified number of Threads allocated to the pool.

If the size is greater than the MAX number of threads in the pool, then only MAX threads are reservved. If the size is smaller than the number of threads currently in the pool, than nothing is done.

#### Parameters

<i>size</i>	the number of threads to reserve.
-------------	-----------------------------------

**6.812.4.13** `virtual void decaf::util::concurrent::ThreadPool::setBlockSize ( std::size_t blockSize )`  
`[virtual]`

Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.

#### Parameters

<i>blockSize</i>	Max Thread Block Size
------------------	-----------------------

**6.812.4.14** `virtual void decaf::util::concurrent::ThreadPool::setMaxThreads ( std::size_t maxThreads )`  
`[virtual]`

Sets the Max number of threads this pool can contian.

if this value is smaller than the current size of the pool nothing is done.

#### Parameters

<i>maxThreads</i>	total number of threads that can be pooled
-------------------	--

### 6.812.5 Field Documentation

**6.812.5.1** `const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_BLOCK_SIZE = 3` `[static]`

**6.812.5.2** `const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_POOL_SIZE = 10` `[static]`

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/ThreadPool.h`

## 6.813 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

```
#include <src/main/decaf/lang/Throwable.h>
```

Inheritance diagram for decaf::lang::Throwable:

### Public Member Functions

- **Throwable** () throw ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () const =0  
*Gets the cause of the error; if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.*
- virtual const std::exception \* **getCause** () const =0  
*Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.*
- virtual void **initCause** (const std::exception \*cause)=0  
*Initializes the contained cause exception with the one given.*
- virtual void **setMark** (const char \*file, const int lineNumber)=0  
*Adds a file/line number to the stack trace.*
- virtual **Throwable** \* **clone** () const =0  
*Clones this exception.*
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const =0  
*Provides the stack trace for every point where this exception was caught, marked, and rethrown.*
- virtual void **printStackTrace** () const =0  
*Prints the stack trace to std::err.*
- virtual void **printStackTrace** (std::ostream &stream) const =0  
*Prints the stack trace to the given output stream.*
- virtual std::string **getStackTraceString** () const =0  
*Gets the stack trace as one contiguous string.*

### 6.813.1 Detailed Description

This class represents an error that has occurred. All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1886) class in order to ensure that all Decaf Exceptions are interchangeable with the `std::exception` class.

**Throwable** (p. 3895) can wrap another **Throwable** (p. 3895) as the cause if the error being thrown. The user can inspect the cause by calling `getCause`, the pointer returned is the property of the **Throwable** (p. 3895) instance and will be deleted when it is deleted or goes out of scope.

Since

1.0

### 6.813.2 Constructor & Destructor Documentation

6.813.2.1 `decaf::lang::Throwable::Throwable ( ) throw ()` [inline]

6.813.2.2 `virtual decaf::lang::Throwable::~~Throwable ( ) throw ()` [inline, virtual]

### 6.813.3 Member Function Documentation

6.813.3.1 `virtual Throwable* decaf::lang::Throwable::clone ( ) const` [pure virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

### Returns

Copy of this **Exception** (p. 1886) object

Implemented in `activemq::exceptions::ActiveMQException` (p. 349), `activemq::exceptions::BrokerException` (p. 874), `decaf::internal::net::ssl::openssl::OpenSSLSocketException` (p. 2958), `decaf::io::EOFException` (p. 1883), `decaf::io::InterruptedIOException` (p. 2198), `decaf::io::IOException` (p. 2212), `decaf::io::UnsupportedEncodingException` (p. 4027), `decaf::io::UTFDataFormatException` (p. 4080), `decaf::lang::Exception` (p. 1889), `decaf::lang::exceptions::ClassCastException` (p. 1179), `decaf::lang::exceptions::IllegalArgumentExceptio` (p. 2056), `decaf::lang::exceptions::IllegalMonitorStateException` (p. 2059), `decaf::lang::exceptions::Illegal` (p. 2062), `decaf::lang::exceptions::IllegalThreadStateException` (p. 2065), `decaf::lang::exceptions::IndexC` (p. 2072), `decaf::lang::exceptions::InterruptedException` (p. 2196), `decaf::lang::exceptions::InvalidStateE` (p. 2210), `decaf::lang::exceptions::NoSuchElementException` (p. 2912), `decaf::lang::exceptions::NullPoint` (p. 2918), `decaf::lang::exceptions::NumberFormatException` (p. 2923), `decaf::lang::exceptions::RuntimeE` (p. 3423), `decaf::lang::exceptions::UnsupportedOperationException` (p. 4030), `decaf::net::BindException` (p. 844), `decaf::net::ConnectException` (p. 1296), `decaf::net::HttpRetryException` (p. 2051), `decaf::net::MalformedURLException` (p. 2538), `decaf::net::NoRouteToHostException`

(p. 2907), **decaf::net::PortUnreachableException** (p. 3062), **decaf::net::ProtocolException** (p. 3230), **decaf::net::SocketException** (p. 3629), **decaf::net::SocketTimeoutException** (p. 3652), **decaf::net::UnknownHostException** (p. 4022), **decaf::net::UnknownServiceException** (p. 4024), **decaf::net::URISyntaxException** (p. 4063), **decaf::nio::BufferOverflowException** (p. 966), **decaf::nio::BufferUnderflowException** (p. 969), **decaf::nio::InvalidMarkException** (p. 2206), **decaf::nio::ReadOnlyBufferException** (p. 3263), **decaf::security::cert::CertificateEncodingException** (p. 1118), **decaf::security::cert::CertificateException** (p. 1120), **decaf::security::cert::CertificateExpiredException** (p. 1122), **decaf::security::cert::CertificateNotYetValidException** (p. 1124), **decaf::security::cert::CertificateParsingException** (p. 1126), **decaf::security::GeneralSecurityException** (p. 2037), **decaf::security::InvalidKeyException** (p. 2203), **decaf::security::KeyException** (p. 2368), **decaf::security::KeyManagementException** (p. 2371), **decaf::security::NoSuchAlgorithmException** (p. 2910), **decaf::security::NoSuchProviderException** (p. 2915), **decaf::security::SignatureException** (p. 3604), **decaf::util::concurrent::BrokenBarrierException** (p. 868), **decaf::util::concurrent::CancellationException** (p. 1112), **decaf::util::concurrent::ExecutionException** (p. 1926), **decaf::util::concurrent::RejectedExecutionException** (p. 3282), **decaf::util::concurrent::TimeoutException** (p. 3901), **decaf::util::zip::DataFormatException** (p. 1602), and **decaf::util::zip::ZipException** (p. 4178).

**6.813.3.2** `virtual const std::exception* decaf::lang::Throwable::getCause ( ) const [pure virtual]`

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

#### Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1890).

**6.813.3.3** `virtual std::string decaf::lang::Throwable::getMessage ( ) const [pure virtual]`

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value `cause.getMessage` is then returned.

#### Returns

string errors message

Implemented in **decaf::lang::Exception** (p. 1891).

**6.813.3.4** `virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace ( ) const [pure virtual]`

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

**Returns**

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1891).

**6.813.3.5** `virtual std::string decaf::lang::Throwable::getStackTraceString ( ) const` [pure virtual]

Gets the stack trace as one contiguous string.

**Returns**

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1891).

**6.813.3.6** `virtual void decaf::lang::Throwable::initCause ( const std::exception * cause )` [pure virtual]

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

**Parameters**

<i>cause</i>	The exception that was the cause of this one.
--------------	---

Implemented in **decaf::lang::Exception** (p. 1891).

**6.813.3.7** `virtual void decaf::lang::Throwable::printStackTrace ( ) const` [pure virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 1892).

**6.813.3.8** `virtual void decaf::lang::Throwable::printStackTrace ( std::ostream & stream ) const` [pure virtual]

Prints the stack trace to the given output stream.

**Parameters**

<i>stream</i>	the target output stream.
---------------	---------------------------

Implemented in **decaf::lang::Exception** (p. 1892).

6.813.3.9 virtual void decaf::lang::Throwable::setMark ( const char \* *file*, const int *lineNumber* ) [pure virtual]

Adds a file/line number to the stack trace.

#### Parameters

<i>file</i>	The name of the file calling this method (use <code>__FILE__</code> ).
<i>lineNumber</i>	The line number in the calling file (use <code>__LINE__</code> ).

Implemented in **decaf::lang::Exception** (p. 1892).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Throwable.h**

## 6.814 decaf::util::concurrent::TimeoutException Class Reference

```

*Clones this exception.*

- virtual `~TimeoutException () throw ()`

### 6.814.1 Constructor & Destructor Documentation

**6.814.1.1** `decaf::util::concurrent::TimeoutException::TimeoutException ( ) throw ()`  
[inline]

Default Constructor.

**6.814.1.2** `decaf::util::concurrent::TimeoutException::TimeoutException ( const decaf::lang::Exception & ex ) throw ()` [inline]

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.814.1.3** `decaf::util::concurrent::TimeoutException::TimeoutException ( const TimeoutException & ex ) throw ()` [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	The exception to copy from.
-----------	-----------------------------

**6.814.1.4** `decaf::util::concurrent::TimeoutException::TimeoutException ( const std::exception * cause ) throw ()` [inline]

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.814.1.5** `decaf::util::concurrent::TimeoutException::TimeoutException ( const char * file, const int lineNumber, const char * msg, ... ) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The string message to report
...	list of primitives that are formatted into the message

**6.814.1.6** `decaf::util::concurrent::TimeoutException::TimeoutException ( const char * file,  
const int lineNumber, const std::exception * cause, const char * msg, ... ) throw ()`  
[inline]

Constructor - Initializes the file name and line number where this message occurred.  
Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The string message to report
...	list of primitives that are formatted into the message

**6.814.1.7** `virtual decaf::util::concurrent::TimeoutException::~~TimeoutException ( ) throw ()`  
[inline, virtual]

**6.814.2 Member Function Documentation**

**6.814.2.1** `virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone ( )`  
`const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

**Returns**

a new **TimeoutException** (p. 3899) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1889).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TimeoutException.h`

**6.815 decaf::util::Timer Class Reference**

A facility for threads to schedule tasks for future execution in a background thread.

```
#include <src/main/decaf/util/Timer.h>
```

## Public Member Functions

- **Timer** ()
- virtual  $\sim$ **Timer** ()
- void **cancel** ()

*Terminates this timer, discarding any currently scheduled tasks.*

- std::size\_t **purge** ()

*Removes all canceled tasks from this timer's task queue.*

- void **schedule** (**TimerTask** \*task, long long delay) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )

*Schedules the specified task for execution after the specified delay.*

- void **schedule** (const decaf::lang::Pointer< **TimerTask** > &task, long long delay) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )

- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )

*Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.*

### 6.815.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread. Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 3901) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 3901) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 3901) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the `wait(long)` method.

#### Since

1.0

### 6.815.2 Constructor & Destructor Documentation

6.815.2.1 `decaf::util::Timer::Timer ( )`

6.815.2.2 `virtual decaf::util::Timer::~~Timer ( )` [virtual]

### 6.815.3 Member Function Documentation

6.815.3.1 `void decaf::util::Timer::cancel ( )`

Terminates this timer, discarding any currently scheduled tasks.

Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the `run` method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.815.3.2 `std::size_t decaf::util::Timer::purge ( )`

Removes all canceled tasks from this timer's task queue.

Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p. 3901) to destroy the **TimerTask** (p. 3914) pointer it was originally given, the caller should ensure that they no longer have any references to **TimerTasks** that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to  $n + c \log n$ , where  $n$  is the number of tasks in the queue and  $c$  is the number of canceled tasks.

This method can be called on a **Timer** (p. 3901) object that has no scheduled tasks without error.

#### Returns

the number of tasks removed from the queue.

```
6.815.3.3 void decaf::util::Timer::schedule ( const decaf::lang::Pointer<
    TimerTask > & task, long long delay ) throw (
    decaf::lang::exceptions::NullPointerException,
    decaf::lang::exceptions::IllegalArgumentException,
    decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for execution after the specified delay.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.

#### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, or timer was cancelled.

```
6.815.3.4 void decaf::util::Timer::schedule ( const decaf::lang::Pointer<
    TimerTask > & task, long long delay, long long period )
    throw ( decaf::lang::exceptions::NullPointerException,
    decaf::lang::exceptions::IllegalArgumentException,
    decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

**Exceptions**

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.5** `void decaf::util::Timer::schedule ( TimerTask * task, const Date & firstTime, long long period ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )`

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3914) pointer is considered to be owned by the **Timer** (p. 3901) class once it has been scheduled, the **Timer** (p. 3901) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3901) itself is cancelled. A **TimerTask** (p. 3914) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3901) and the caller should ensure that the **TimerTask** (p. 3914) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3914) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

**Parameters**

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

**Exceptions**

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.6** void decaf::util::Timer::schedule ( **TimerTask** \* *task*, const Date & *time* ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 3914) pointer is considered to be owned by the **Timer** (p. 3901) class once it has been scheduled, the **Timer** (p. 3901) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3901) itself is cancelled. A **TimerTask** (p. 3914) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3901) and the caller should ensure that the **TimerTask** (p. 3914) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3914) instance are planned.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>time</i>	- time at which task is to be executed.

#### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.7** void decaf::util::Timer::schedule ( const decaf::lang::Pointer< **TimerTask** > & *task*, const Date & *firstTime*, long long *period* ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

#### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if <code>time.getTime()</code> is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.8** `void decaf::util::Timer::schedule ( TimerTask * task, long long delay ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )`

Schedules the specified task for execution after the specified delay.

The **TimerTask** (p. 3914) pointer is considered to be owned by the **Timer** (p. 3901) class once it has been scheduled, the **Timer** (p. 3901) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3901) itself is cancelled. A **TimerTask** (p. 3914) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3901) and the caller should ensure that the **TimerTask** (p. 3914) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3914) instance are planned.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.

**Exceptions**

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, or timer was cancelled.

**6.815.3.9** void decaf::util::Timer::schedule ( **TimerTask** \* *task*, long long *delay*, long long *period* ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3914) pointer is considered to be owned by the **Timer** (p. 3901) class once it has been scheduled, the **Timer** (p. 3901) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3901) itself is cancelled. A **TimerTask** (p. 3914) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3901) and the caller should ensure that the **TimerTask** (p. 3914) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3914) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

**Parameters**

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

**Exceptions**

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
-----------------------------	--

<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.10** `void decaf::util::Timer::schedule ( const decaf::lang::Pointer< TimerTask > & task, const Date & time ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )`

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>time</i>	- time at which task is to be executed.

#### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.11** `void decaf::util::Timer::scheduleAtFixedRate ( TimerTask * task, long long delay, long long period ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )`

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3914) pointer is considered to be owned by the **Timer** (p. 3901) class once it has been scheduled, the **Timer** (p. 3901) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3901) itself is cancelled. A **TimerTask** (p. 3914) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3901) and the caller should ensure that the **TimerTask** (p. 3914) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3914) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

### Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + <code>System.currentTimeMillis()</code> is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.815.3.12 void decaf::util::Timer::scheduleAtFixedRate ( const decaf::lang::Pointer<
TimerTask > & task, long long delay, long long period )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance

every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

#### Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

#### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.13** `void decaf::util::Timer::scheduleAtFixedRate ( const decaf::lang::Pointer< TimerTask > & task, const Date & firstTime, long long period ) throw ( decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException )`

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

#### Parameters

<i>task</i>	- task to be scheduled.
-------------	-------------------------

<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

**6.815.3.14** void decaf::util::Timer::scheduleAtFixedRate ( **TimerTask**  
 \* *task*, const Date & *firstTime*, long long *period* ) throw  
 ( decaf::lang::exceptions::NullPointerException,  
 decaf::lang::exceptions::IllegalArgumentException,  
 decaf::lang::exceptions::IllegalStateException )

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3914) pointer is considered to be owned by the **Timer** (p. 3901) class once it has been scheduled, the **Timer** (p. 3901) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3901) itself is cancelled. A **TimerTask** (p. 3914) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3901) and the caller should ensure that the **TimerTask** (p. 3914) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3914) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

### Parameters

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

### Exceptions

<i>NullPointerException</i>	- if the <b>TimerTask</b> (p. 3914) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

## 6.816.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 3901).

### Since

1.0

## 6.816.2 Constructor & Destructor Documentation

**6.816.2.1** `decaf::util::TimerTask::TimerTask ( )`

**6.816.2.2** `virtual decaf::util::TimerTask::~~TimerTask ( )` [`inline`, `virtual`]

## 6.816.3 Member Function Documentation

**6.816.3.1** `bool decaf::util::TimerTask::cancel ( )`

Cancels this timer task.

If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

## Returns

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

**6.816.3.2** `long long decaf::util::TimerTask::getWhen ( ) const` [protected]

**6.816.3.3** `bool decaf::util::TimerTask::isScheduled ( ) const` [protected]

**6.816.3.4** `long long decaf::util::TimerTask::scheduledExecutionTime ( ) const`

Returns the scheduled execution time of the most recent actual execution of this task.

(If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

```
void run() (p. 3419) { if( System::currentTimeMillis() - scheduledExecutionTime()
(p. 3916) >= MAX_TARDINESS) return; // Too late; skip this execution. // Perform
the task }
```

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

### Returns

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 1722). The return value is undefined if the task has yet to commence its first execution.

**6.816.3.5** `void decaf::util::TimerTask::setScheduledTime ( long long time )` [protected]

- std::size\_t **size** () const
- void **insert** (const **Pointer**< **TimerTask** > &task)

*Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.*

- void **remove** (std::size\_t pos)

*Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.*

- void **reset** ()

*Clear all contents from the heap.*

- void **adjustMinimum** ()

*Resorts the heap starting at the top.*

- std::size\_t **deleteIfCancelled** ()

*Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a cancellation of a large number of tasks the user can perform this purge.*

- std::size\_t **find** (const **Pointer**< **TimerTask** > &task) const

*Searches the heap for the specified TimerTask element and returns its position in the heap.*

### 6.817.1 Detailed Description

A Binary Heap implemented specifically for the Timer class in Decaf Util.

Since

1.0

## 6.817.2 Constructor & Destructor Documentation

6.817.2.1 `decaf::internal::util::TimerTaskHeap::TimerTaskHeap ( )`

6.817.2.2 `virtual decaf::internal::util::TimerTaskHeap::~~TimerTaskHeap ( )` [*virtual*]

## 6.817.3 Member Function Documentation

6.817.3.1 `void decaf::internal::util::TimerTaskHeap::adjustMinimum ( )`

Resorts the heap starting at the top.

6.817.3.2 `std::size_t decaf::internal::util::TimerTaskHeap::deleteIfCancelled ( )`

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

### Returns

the number of task that were removed from the heap because they were cancelled.

6.817.3.3 `std::size_t decaf::internal::util::TimerTaskHeap::find ( const Pointer< TimerTask > & task ) const`

Searches the heap for the specified TimerTask element and returns its position in the heap.

Returns the unsigned equivalent of -1 if the element is not found.

### Returns

the position in the Heap where the Task is stored, or npos.

6.817.3.4 `void decaf::internal::util::TimerTaskHeap::insert ( const Pointer< TimerTask > & task )`

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

### Parameters

<i>task</i>	The TimerTask to insert into the heap.
-------------	--

**6.817.3.5** `bool decaf::internal::util::TimerTaskHeap::isEmpty ( ) const`

#### Returns

true if the heap is empty.

**6.817.3.6** `Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ( )`

Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

#### Returns

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

**6.817.3.7** `void decaf::internal::util::TimerTaskHeap::remove ( std::size_t pos )`

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

#### Parameters

<i>pos</i>	The position at which to remove the TimerTask and begin a resort of the heap.
------------	---

**6.817.3.8** `void decaf::internal::util::TimerTaskHeap::reset ( )`

Clear all contents from the heap.

**6.817.3.9** `std::size_t decaf::internal::util::TimerTaskHeap::size ( ) const`

#### Returns

the size of the heap.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/util/TimerTaskHeap.h`

## 6.818 decaf::util::concurrent::TimeUnit Class Reference

A **TimeUnit** (p. 3919) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.

```
#include <src/main/decaf/util/concurrent/TimeUnit.h>
```

Inheritance diagram for decaf::util::concurrent::TimeUnit:

## Public Member Functions

### 6.818.1 Detailed Description

A **TimeUnit** (p. 3919) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units. A **TimeUnit** (p. 3919) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 3919) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

```
Lock (p. 2450) lock = ...; if ( lock.tryLock( 50, TimeUnit.MILLISECONDS (p. 3929) ) ) ...
```

while this code will timeout in 50 seconds:

```
Lock (p. 2450) lock = ...; if ( lock.tryLock( 50, TimeUnit.SECONDS (p. 3930) ) ) ...
```

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 3919).

### 6.818.2 Constructor & Destructor Documentation

**6.818.2.1** `decaf::util::concurrent::TimeUnit::TimeUnit ( int index, const std::string & name )`  
[protected]

Hidden Constructor, this class can not be instantiated directly.

#### Parameters

<i>index</i>	- Index into the Time Unit set.
<i>name</i>	- Name of the unit type being represented.

**6.818.2.2** `virtual decaf::util::concurrent::TimeUnit::~~TimeUnit ( )` [inline, virtual]

### 6.818.3 Member Function Documentation

**6.818.3.1** `virtual int decaf::util::concurrent::TimeUnit::compareTo ( const TimeUnit & value )`  
`const` [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all `x` and `y`. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementor must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all `z`.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the `Comparable` interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

#### Parameters

<i>value</i>	- the Object to be compared.
--------------	------------------------------

#### Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

#### 6.818.3.2 long long decaf::util::concurrent::TimeUnit::convert ( long long *sourceDuration*, const *TimeUnit* & *sourceUnit* ) const

Convert the given time duration in the given unit to this unit.

Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to `Long.MIN_VALUE` if negative or `Long.MAX_VALUE` if positive.

For example, to convert 10 minutes to milliseconds, use: `TimeUnit.MILLISECONDS.convert(10L, TimeUnit.MINUTES)` (p. 3929))

#### Parameters

<i>sourceDuration</i>	- Duration value to convert.
<i>sourceUnit</i>	- Unit type of the source duration.

#### Returns

the converted duration in this unit, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

**6.818.3.3** `virtual bool decaf::util::concurrent::TimeUnit::equals ( const TimeUnit & value )`  
`const` [virtual]

#### Returns

true if this value is considered equal to the passed value.

**6.818.3.4** `virtual bool decaf::util::concurrent::TimeUnit::operator< ( const TimeUnit & value )`  
`const` [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

#### Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

#### Returns

true if this object is equal to the one passed.

**6.818.3.5** `virtual bool decaf::util::concurrent::TimeUnit::operator== ( const TimeUnit & value ) const` [virtual]

Compares equality between this object and the one passed.

#### Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

#### Returns

true if this object is equal to the one passed.

**6.818.3.6** `void decaf::util::concurrent::TimeUnit::sleep ( long long timeout ) const throw ( decaf::lang::exceptions::InterruptedException )`

Perform a `Thread.sleep` using this unit.

This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

#### Parameters

<i>timeout</i>	the minimum time to sleep
----------------	---------------------------

**See also**

Thread::sleep

**6.818.3.7** void decaf::util::concurrent::TimeUnit::timedJoin ( decaf::lang::Thread \* *thread*, long long *timeout* ) throw ( decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException )

Perform a timed Thread.join using this time unit.

This is a convenience method that converts time arguments into the form required by the Thread.join method.

**Parameters**

<i>thread</i>	the thread to wait for
<i>timeout</i>	the maximum time to wait

**Exceptions**

<i>InterruptedException</i>	if interrupted while waiting.
<i>NullPointerException</i>	if the thread object is null.

**See also**

Thread::join( long long, long long )

**6.818.3.8** void decaf::util::concurrent::TimeUnit::timedWait ( Synchronizable \* *obj*, long long *timeout* ) const throw ( decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException )

Perform a timed Object.wait using this time unit.

This is a convenience method that converts timeout arguments into the form required by the Object.wait method.

For example, you could implement a blocking poll method (see **BlockingQueue.poll** (p. 854)) using:

```
Object poll( long long timeout, const TimeUnit& unit )
    throw( InterruptedException ) {

    while( empty ) {
        unit.timedWait(this, timeout);
        ...
    }
}
```

**Parameters**

<i>obj</i>	the object to wait on
<i>timeout</i>	the maximum time to wait.

**Exceptions**

<i>InterruptedException</i>	if interrupted while waiting.
<i>NullPointerException</i>	if the <b>Synchronizable</b> (p. 3811) object is null.

**See also**

`Synchronizable::wait( long long, long long )`

**6.818.3.9** `long long decaf::util::concurrent::TimeUnit::toDays ( long long duration ) const`  
`[inline]`

Equivalent to `DAYS.convert( duration, this )`.

**Parameters**

<i>duration</i>	the duration
-----------------	--------------

**Returns**

the converted duration.

**See also**

**convert** (p. 3923)

**6.818.3.10** `long long decaf::util::concurrent::TimeUnit::toHours ( long long duration ) const`  
`[inline]`

Equivalent to `HOURS.convert( duration, this )`.

**Parameters**

<i>duration</i>	the duration
-----------------	--------------

**Returns**

the converted duration.

**See also**

**convert** (p. 3923)

**6.818.3.11** `long long decaf::util::concurrent::TimeUnit::toMicros ( long long duration ) const`  
[inline]

Equivalent to `MICROSECONDS.convert (duration, this)`.

#### Parameters

<i>duration</i>	the duration
-----------------	--------------

#### Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

#### See also

`convert` (p. 3923)

**6.818.3.12** `long long decaf::util::concurrent::TimeUnit::toMillis ( long long duration ) const`  
[inline]

Equivalent to `MILLISECONDS.convert (duration, this)`.

#### Parameters

<i>duration</i>	the duration
-----------------	--------------

#### Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

#### See also

`convert` (p. 3923)

**6.818.3.13** `long long decaf::util::concurrent::TimeUnit::toMinutes ( long long duration ) const`  
[inline]

Equivalent to `MINUTES.convert (duration, this)`.

#### Parameters

<i>duration</i>	the duration
-----------------	--------------

#### Returns

the converted duration.

**See also****convert** (p. 3923)

**6.818.3.14** `long long decaf::util::concurrent::TimeUnit::toNanos ( long long duration ) const`  
`[inline]`

Equivalent to `NANOSECONDS.convert (duration, this)`.

**Parameters**

<i>duration</i>	the duration
-----------------	--------------

**Returns**

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

**See also****convert** (p. 3923)

**6.818.3.15** `long long decaf::util::concurrent::TimeUnit::toSeconds ( long long duration ) const`  
`[inline]`

Equivalent to `SECONDS.convert (duration, this)`.

**Parameters**

<i>duration</i>	the duration
-----------------	--------------

**Returns**

the converted duration.

**See also****convert** (p. 3923)

**6.818.3.16** `virtual std::string decaf::util::concurrent::TimeUnit::toString ( ) const`  
`[virtual]`

Converts the **TimeUnit** (p. 3919) type to the Name of the **TimeUnit** (p. 3919).

**Returns**

String name of the **TimeUnit** (p. 3919)

```
6.818.3.17 static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf
( const std::string & name ) throw ( de-
caf::lang::exceptions::IllegalArgumentException )
[static]
```

Returns the **TimeUnit** (p. 3919) constant of this type with the specified name.

The string must match exactly an identifier used to declare an **TimeUnit** (p. 3919) constant in this type. (Extraneous whitespace characters are not permitted.)

#### Parameters

<i>name</i>	The Name of the <b>TimeUnit</b> (p. 3919) constant to be returned.
-------------	--

#### Returns

A constant reference to the **TimeUnit** (p. 3919) Constant with the given name.

#### Exceptions

<i>IllegalArgumentException</i>	if this enum type has no constant with the specified name
---------------------------------	---

### 6.818.4 Field Documentation

```
6.818.4.1 const TimeUnit decaf::util::concurrent::TimeUnit::DAYS [static]
```

```
6.818.4.2 const TimeUnit decaf::util::concurrent::TimeUnit::HOURS
[static]
```

```
6.818.4.3 const TimeUnit decaf::util::concurrent::TimeUnit::MICROSECONDS
[static]
```

`[static]`

The An Array of **TimeUnit** (p. 3919) Instances.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TimeUnit.h`

## 6.819 cms::Topic Class Reference

An interface encapsulating a provider-specific topic name.

```
#include <src/main/cms/Topic.h>
```

Inheritance diagram for cms::Topic:

### Public Member Functions

- `virtual ~Topic ()`
- `virtual std::string getTopicName () const =0 throw ( CMSException )`

*Gets the name of this topic.*

### 6.819.1 Detailed Description

An interface encapsulating a provider-specific topic name. A **Topic** (p. 3930) is a Publish / Subscribe type **Destination** (p. 1776). All Messages sent to a **Topic** (p. 3930) are broadcast to all Subscribers of that **Topic** (p. 3930) unless the Subscriber defines a **Message** (p. 2614) selector that filters out that **Message** (p. 2614).

Since

1.0

## 6.819.2 Constructor & Destructor Documentation

6.819.2.1 virtual cms::Topic::~Topic ( ) [inline, virtual]

## 6.819.3 Member Function Documentation

6.819.3.1 virtual std::string cms::Topic::getTopicName ( ) const throw ( CMSEException )  
[pure virtual]

Gets the name of this topic.

### Returns

The topic name.

### Exceptions

<b>CMSEException</b> (p. 1190)	- If an internal error occurs.
-----------------------------------	--------------------------------

Implemented in **activemq::commands::ActiveMQTopic** (p. 700).

The documentation for this class was generated from the following file:

- src/main/cms/**Topic.h**

## 6.820 activemq::state::Tracked Class Reference

```
#include <src/main/activemq/state/Tracked.h>
```

Inheritance diagram for activemq::state::Tracked:

### Public Member Functions

- **Tracked** ()
- **Tracked** (const **Pointer**< **decaf::lang::Runnable** > &runnable)
- virtual **~Tracked** ()
- void **onResponse** ()
- bool **isWaitingForResponse** () const

### 6.820.1 Constructor & Destructor Documentation

6.820.1.1 `activemq::state::Tracked::Tracked ( ) [inline]`

6.820.1.2 `activemq::state::Tracked::Tracked ( const Pointer< decaf::lang::Runnable > &runnable )`

6.820.1.3 `virtual activemq::state::Tracked::~~Tracked ( ) [inline, virtual]`

### 6.820.2 Member Function Documentation

6.820.2.1 `bool activemq::state::Tracked::isWaitingForResponse ( ) const [inline]`

6.820.2.2 `void activemq::state::Tracked::onResponse ( )`

The documentation for this class was generated from the following file:

- `src/main/activemq/state/Tracked.h`

## 6.821 activemq::commands::TransactionId Class Reference

```
#include <src/main/activemq/commands/TransactionId.h>
```

Inheritance diagram for `activemq::commands::TransactionId`:

### Public Types

- `typedef decaf::lang::PointerComparator< TransactionId > COMPARATOR`

### Public Member Functions

- `TransactionId ()`
- `TransactionId (const TransactionId &other)`
- `virtual ~TransactionId ()`
- `virtual unsigned char getDataStructureType () const`  
*Get the unique identifier that this object and its own Marshaler share.*
- `virtual TransactionId * cloneDataStructure () const`  
*Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.*
- `virtual void copyDataStructure (const DataStructure *src)`  
*Copy the contents of the passed object into this object's members, overwriting any existing data.*

- virtual std::string **toString** () const  
*Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** \*value) const  
*Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.*
- virtual int **compareTo** (const **TransactionId** &value) const
- virtual bool **equals** (const **TransactionId** &value) const
- virtual bool **operator==** (const **TransactionId** &value) const
- virtual bool **operator<** (const **TransactionId** &value) const
- **TransactionId** & **operator=** (const **TransactionId** &other)

### Static Public Attributes

- static const unsigned char **ID\_TRANSACTIONID** = 0

### 6.821.1 Member Typedef Documentation

6.821.1.1 `typedef decaf::lang::PointerComparator<TransactionId>  
activemq::commands::TransactionId::COMPARATOR`

Reimplemented in `activemq::commands::LocalTransactionId` (p. 2421), and `activemq::commands::XATransactionId` (p. 4144).

### 6.821.2 Constructor & Destructor Documentation

6.821.2.1 `activemq::commands::TransactionId::TransactionId ( )`

6.821.2.2 `activemq::commands::TransactionId::TransactionId ( const TransactionId & other )`

6.821.2.3 `virtual activemq::commands::TransactionId::~~TransactionId ( ) [virtual]`

### 6.821.3 Member Function Documentation

6.821.3.1 `virtual TransactionId* activemq::commands::TransactionId::cloneDataStructure ( ) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 2422), and **activemq::commands::XATransactionId** (p. 4144).

**6.821.3.2** `virtual int activemq::commands::TransactionId::compareTo ( const TransactionId & value ) const` [virtual]

**6.821.3.3** `virtual void activemq::commands::TransactionId::copyDataStructure ( const DataStructure * src )` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

#### Parameters

<i>src</i>	- Source Object
------------	-----------------

Implements **activemq::commands::DataStructure** (p. 1715).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 2422), and **activemq::commands::XATransactionId** (p. 4145).

**6.821.3.4** `virtual bool activemq::commands::TransactionId::equals ( const DataStructure * value ) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1716).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 2422), and **activemq::commands::XATransactionId** (p. 4145).

**6.821.3.5** `virtual bool activemq::commands::TransactionId::equals ( const TransactionId & value ) const` [virtual]

**6.821.3.6** `virtual unsigned char activemq::commands::TransactionId::getDataStructureType ( ) const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataStructure** (p. 1713) type copy.

## 6.822 activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller

### Class Reference

---

3939

Implements **activemq::commands::DataStructure** (p. 1717).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 2423), and **activemq::commands::XATransactionId** (p. 4145).

6.821.3.7 `virtual bool activemq::commands::TransactionId::operator< ( const TransactionId & value ) const` [virtual]

6.821.3.8 `TransactionId& activemq::commands::TransactionId::operator= ( const TransactionId & other )`

6.821.3.9 `virtual bool activemq::commands::TransactionId::operator== ( const TransactionId & value ) const` [virtual]

6.821.3.10 `virtual std::string activemq::commands::TransactionId::toString ( ) const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 841).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 2424), and **activemq::commands::XATransactionId** (p. 4146).

### 6.821.4 Field Documentation

6.821.4.1 `const unsigned char activemq::commands::TransactionId::ID_TRANSACTIONID = 0` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/TransactionId.h`

## 6.822 activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller

### Class Reference

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3935).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/TransactionIdMarshaller.h>

### 6.822.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3935). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.822.2 Constructor & Destructor Documentation

- 6.822.2.1 `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::TransactionIdMarshaller ( ) [inline]`
- 6.822.2.2 `virtual activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::~~TransactionIdMarshaller ( ) [inline, virtual]`

## 6.822.3 Member Function Documentation

- 6.822.3.1 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1675).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller` (p. 2439), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 4170).

- 6.822.3.2 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller** (p. 2440), and **activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller** (p. 4170).

```
6.822.3.3  virtual int activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller** (p. 2440), and **activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller** (p. 4171).

```
6.822.3.4  virtual void activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.823 activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller

### Class Reference

3943

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller** (p. 2441), and **activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller** (p. 4171).

**6.822.3.5** virtual void **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::tightUnmarshal**  
( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \*  
*dataStructure*, **decaf::io::DataInputStream** \* *dataIn*, **utils::BooleanStream**  
\* *bs* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller** (p. 2441), and **activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller** (p. 4172).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**TransactionIdMarshaller.h**

## 6.823 activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller

### Class Reference

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3939).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/TransactionIdMarshaller.
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller`:

### 6.823.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3939). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

## 6.823.2 Constructor & Destructor Documentation

- 6.823.2.1 `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::TransactionIdMarshaller ( ) [inline]`
- 6.823.2.2 `virtual activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::~~TransactionIdMarshaller ( ) [inline, virtual]`

## 6.823.3 Member Function Documentation

- 6.823.3.1 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1675).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 2448), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 4161).

- 6.823.3.2 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2448), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 4162).

```
6.823.3.3  virtual int activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2449), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 4162).

```
6.823.3.4  virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.824 activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller

### Class Reference

3947

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2449), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 4163).

```
6.823.3.5 virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2450), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 4163).

The documentation for this class was generated from the following file:

[virtual]

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 2436), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 4167).

**6.825.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.826 activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller

### Class Reference

3955

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 2436), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 4167).

```
6.825.3.5 virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 2437), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 4168).

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3951). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

## 6.826.2 Constructor & Destructor Documentation

- 6.826.2.1 `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::TransactionIdMarshaller ( ) [inline]`
- 6.826.2.2 `virtual activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::~~TransactionIdMarshaller ( ) [inline, virtual]`

## 6.826.3 Member Function Documentation

- 6.826.3.1 `virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1675).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller` (p. 2443), and `activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller` (p. 4157).

- 6.826.3.2 `virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2444), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 4158).

**6.826.3.3** `virtual int activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2444), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 4158).

**6.826.3.4** `virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

## 6.827 activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller

### Class Reference

3959

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2445), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 4159).

```
6.826.3.5 virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2445), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 4159).

### 6.827.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3955). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

## 6.827.2 Constructor & Destructor Documentation

- 6.827.2.1 `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::TransactionIdMarshaller ( ) [inline]`
- 6.827.2.2 `virtual activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::~~TransactionIdMarshaller ( ) [inline, virtual]`

## 6.827.3 Member Function Documentation

- 6.827.3.1 `virtual void activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1675).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller` (p. 2426), and `activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller` (p. 4149).

- 6.827.3.2 `virtual void activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1683).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller** (p. 2427), and **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller** (p. 4149).

```
6.827.3.3  virtual int activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1690).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller** (p. 2427), and **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller** (p. 4150).

```
6.827.3.4  virtual void activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1698).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller** (p. 2428), and **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller** (p. 4150).

```
6.827.3.5 virtual void activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1706).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller** (p. 2428), and **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller** (p. 4151).

The documentation for this class was generated from the following file:

## 6.828.1 Constructor & Destructor Documentation

6.828.1.1 `activemq::commands::TransactionInfo::TransactionInfo ( )`

6.828.1.2 `virtual activemq::commands::TransactionInfo::~~TransactionInfo ( ) [virtual]`

## 6.828.2 Member Function Documentation

6.828.2.1 `virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure ( ) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1714).

6.828.2.2 `virtual void activemq::commands::TransactionInfo::copyDataStructure ( const DataStructure * src ) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

### Parameters

<i>src</i>	- Source Object
------------	-----------------

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.828.2.3 `virtual bool activemq::commands::TransactionInfo::equals ( const DataStructure * value ) const [virtual]`

Compares the `DataStructure` (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

### Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 766).

6.828.2.4 **virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ( ) const**  
[virtual]

6.828.2.5 **virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ( )**  
[virtual]

6.828.2.6 **virtual unsigned char activemq::commands::TransactionInfo::getDataStructureType ( ) const** [virtual]

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSet** (p. 1713) type copy.

Implements **activemq::commands::DataSet** (p. 1717).

6.828.2.7 **virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ( ) const**  
[virtual]

6.828.2.8 **virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ( )**  
[virtual]

6.828.2.9 **virtual unsigned char activemq::commands::TransactionInfo::getType ( ) const**  
[virtual]

6.828.2.10 **virtual bool activemq::commands::TransactionInfo::isTransactionInfo ( ) const**  
[inline, virtual]

#### Returns

an answer of true to the **isTransactionInfo()** (p. 3962) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

- 6.828.2.11 `virtual void activemq::commands::TransactionInfo::setConnectionId ( const Pointer< ConnectionId > & connectionId ) [virtual]`
- 6.828.2.12 `virtual void activemq::commands::TransactionInfo::setTransactionId ( const Pointer< TransactionId > & transactionId ) [virtual]`
- 6.828.2.13 `virtual void activemq::commands::TransactionInfo::setType ( unsigned char type ) [virtual]`
- 6.828.2.14 `virtual std::string activemq::commands::TransactionInfo::toString ( ) const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

- 6.828.2.15 `virtual Pointer<Command> activemq::commands::TransactionInfo::visit ( activemq::state::CommandVisitor * visitor ) throw ( exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.828.3 Field Documentation

### 6.829.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3964).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.829.2 Constructor & Destructor Documentation

**6.829.2.1** **activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::TransactionInfoMarshaller**  
( ) [inline]

**6.829.2.2** **virtual activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::~~TransactionInfoMarshaller**  
( ) [inline, virtual]

### 6.829.3 Member Function Documentation

**6.829.3.1** **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::createObject** (  
) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.829.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

**6.829.3.3** `virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 794).

**6.829.3.4** `virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

6.829

**activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller**

**Class Reference**

**3971**

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 795).

**6.829.3.5** `virtual int activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 796).

**6.829.3.6** `virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException )`  
[virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 797).

```

6.829.3.7 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 799).

The documentation for this class was generated from the following file:

### 6.830.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p.3968).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.830.2 Constructor & Destructor Documentation

6.830.2.1 **activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::TransactionInfoMarshaller**  
( ) [inline]

6.830.2.2 **virtual activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::~~TransactionInfoMarshaller**  
( ) [inline, virtual]

### 6.830.3 Member Function Documentation

6.830.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::createObject** ( ) const [virtual]

Creates a new instance of this marshalable type.

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.830.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.830.3.3** `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 787).

**6.830.3.4** `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

6.830

activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller

Class Reference

3975

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 788).

```
6.830.3.5  virtual int activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Returns

int value indicating the size of the marshaled object.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 789).

```
6.830.3.6  virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 790).

```
6.830.3.7 virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 792).

The documentation for this class was generated from the following file:

## 6.831.3 Member Function Documentation

6.831.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1661).

6.831.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1668).

6.831.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

6.831

**activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller****Class Reference****3979****Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 772).

**6.831.3.4** `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.

**6.831.3.5** `virtual int activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal1 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 775).

```
6.831.3.6 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 776).

```
6.831.3.7 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 777).

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 803).

```
6.832.3.6 virtual void activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 804).

```
6.832.3.7 virtual void activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 780).

**6.833.3.4** virtual void **activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::looseUnmarshal** ( **OpenWireFormat** \* *wireFormat*, **commands::DataStructure** \* *dataStructure*, **decaf::io::DataInputStream** \* *dataIn* ) throw ( **decaf::io::IOException** ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 781).

```

6.833.3.5  virtual int activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 782).

```

6.833.3.6  virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 783).

6.834

activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller

Class Reference

3989

6.833.3.7 virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream  
\* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 784).

### 6.834.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p.3985).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

### 6.834.2 Constructor & Destructor Documentation

6.834.2.1 **activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::TransactionInfoMarshaller**  
( ) [inline]

6.834.2.2 **virtual activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::~~TransactionInfoMarshaller**  
( ) [inline, virtual]

### 6.834.3 Member Function Documentation

6.834.3.1 **virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::createObject** ( ) const [virtual]

Creates a new instance of this marshalable type.

6.834

**activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller**

**Class Reference**

**3991**

**Returns**

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1661).

**6.834.3.2** `virtual unsigned char activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

**Returns**

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1668).

**6.834.3.3** `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 808).

**6.834.3.4** `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
-------------------	---

<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 809).

```
6.834.3.5  virtual int activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 810).

```
6.834.3.6  virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
  * dataStructure, decaf::io::DataOutputStream * dataOut,
  utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write a object instance to data output stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled

<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 811).

**6.834.3.7** virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightUnmarshal ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 813).

*Performs a take.*

### 6.837.1 Detailed Description

template<typename E> class decaf::internal::util::concurrent::TransferQueue< E >

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers. The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

### 6.837.2 Constructor & Destructor Documentation

6.837.2.1 template<typename E> decaf::internal::util::concurrent::TransferQueue< E>::TransferQueue ( ) [inline]

Node class for **TransferQueue** (p. 3992).

Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.837.2.2 template<typename E> virtual decaf::internal::util::concurrent::TransferQueue< E>::~~TransferQueue ( ) [inline, virtual]

### 6.837.3 Member Function Documentation

6.837.3.1 template<typename E> virtual void decaf::internal::util::concurrent::TransferQueue< E>::transfer ( E \* e, bool *timed*, long long *nanos* ) throw ( decaf::util::concurrent::TimeoutException, decaf::lang::exceptions::InterruptedException ) [inline, virtual]

Performs a put.

#### Parameters

<i>e</i>	the item to be handed to a consumer;
<i>timed</i>	if this operation should timeout
<i>nanos</i>	the timeout, in nanoseconds

#### Exceptions

<i>TimeoutException</i>	if the operation timed out waiting for the consumer to accept the item offered.
<i>InterruptedException</i>	if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3991).

```

6.837.3.2  template<typename E > virtual E*
           decaf::internal::util::concurrent::TransferQueue<
           E >::transfer ( bool timed, long long nanos ) throw
           ( decaf::util::concurrent::TimeoutException,
           decaf::lang::exceptions::InterruptedException ) [inline,
           virtual]

```

Performs a take.

#### Parameters

<i>timed</i>	if this operation should timeout
<i>nanos</i>	the timeout, in nanoseconds

#### Returns

the item provided or received;

#### Exceptions

<i>TimeoutException</i>	if the operation timed out waiting for the producer to offer an item.
<i>InterruptedException</i>	if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer**< E > (p. 3991).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**TransferQueue.h**

## 6.838 decaf::internal::util::concurrent::TransferStack< E > Class Template Reference

*reconnect to another location*

### 6.839.1 Detailed Description

Interface for a transport layer for command objects. Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 3996) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 3996) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

## 6.839.2 Constructor & Destructor Documentation

6.839.2.1 `virtual activemq::transport::Transport::~~Transport ( ) [inline, virtual]`

## 6.839.3 Member Function Documentation

6.839.3.1 `virtual std::string activemq::transport::Transport::getRemoteAddress ( ) const [pure virtual]`

### Returns

the remote address for this connection

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1934), `activemq::transport::IOTransport` (p. 2216), `activemq::transport::mock::MockTransport` (p. 2858), and `activemq::transport::TransportFilter` (p. 4008).

6.839.3.2 `virtual TransportListener* activemq::transport::Transport::getTransportListener ( ) const [pure virtual]`

Gets the observer of asynchronous events from this transport.

### Returns

the listener of transport events.

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1935), `activemq::transport::IOTransport` (p. 2216), `activemq::transport::mock::MockTransport` (p. 2858), and `activemq::transport::TransportFilter` (p. 4008).

6.839.3.3 `virtual bool activemq::transport::Transport::isClosed ( ) const [pure virtual]`

Has the **Transport** (p. 3996) been shutdown and no longer usable.

### Returns

true if the **Transport** (p. 3996)

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1935), `activemq::transport::IOTransport` (p. 2216), `activemq::transport::mock::MockTransport` (p. 2859), `activemq::transport::tcp::TcpTransport` (p. 3868), and `activemq::transport::TransportFilter` (p. 4008).

6.839.3.4 `virtual bool activemq::transport::Transport::isConnected ( ) const [pure virtual]`

Is the **Transport** (p. 3996) Connected to its Broker.

**Returns**

true if a connection has been made.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1936), **activemq::transport::IOTransport** (p. 2216), **activemq::transport::mock::MockTransport** (p. 2859), **activemq::transport::tcp::TcpTransport** (p. 3868), and **activemq::transport::TransportFilter** (p. 4008).

**6.839.3.5** `virtual bool activemq::transport::Transport::isFaultTolerant ( ) const` [pure virtual]

Is this **Transport** (p. 3996) fault tolerant, meaning that it will reconnect to a broker on disconnect.

**Returns**

true if the **Transport** (p. 3996) is fault tolerant.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1936), **activemq::transport::IOTransport** (p. 2217), **activemq::transport::mock::MockTransport** (p. 2859), **activemq::transport::tcp::TcpTransport** (p. 3868), and **activemq::transport::TransportFilter** (p. 4009).

Referenced by **activemq::transport::TransportFilter::isFaultTolerant()**.

**6.839.3.6** `virtual Transport* activemq::transport::Transport::narrow ( const std::type_info & typeId )` [pure virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3996) to allow a higher level transport to skip intermediate Transports in certain circumstances.

**Parameters**

<i>typeId</i> - The type_info of the Object we are searching for.
---

**Returns**

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1937), **activemq::transport::IOTransport** (p. 2217), **activemq::transport::mock::MockTransport** (p. 2860), and **activemq::transport::TransportFilter** (p. 4009).

Referenced by **activemq::transport::failover::FailoverTransport::narrow()**.

**6.839.3.7** `virtual void activemq::transport::Transport::oneway ( const Pointer< Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )` [pure virtual]

Sends a one-way command.

Does not wait for any response from the broker.

#### Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

#### Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3386), **activemq::transport::failover::FailoverTransport** (p. 1937), **activemq::transport::inactivity::InactivityMonitor** (p. 2068), **activemq::transport::IOTransport** (p. 2217), **activemq::transport::logging::LoggingTransport** (p. 2479), **activemq::transport::mock::MockTransport** (p. 2860), **activemq::transport::TransportFilter** (p. 4010), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2987).

**6.839.3.8** `virtual void activemq::transport::Transport::reconnect ( const decaf::net::URI & uri ) throw ( decaf::io::IOException ) [pure virtual]`

reconnect to another location

#### Parameters

<i>uri</i>	
------------	--

#### Exceptions

<i>IOException</i>	on failure of if not supported
--------------------	--------------------------------

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1938), and **activemq::transport::TransportFilter** (p. 4010).

**6.839.3.9** `virtual Pointer<Response> activemq::transport::Transport::request ( const Pointer< Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [pure virtual]`

Sends the given command to the broker and then waits for the response.

#### Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

#### Returns

the response from the broker.

**Exceptions**

<i>IOException</i>	if an exception occurs during the read of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3387), **activemq::transport::failover::FailoverTransport** (p. 1939), **activemq::transport::IOTransport** (p. 2218), **activemq::transport::logging::LoggingTransport** (p. 2479), **activemq::transport::mock::MockTransport** (p. 2861), **activemq::transport::TransportFilter** (p. 4011), and **activemq::wireformat::openwire::OpenWireFormatNeg** (p. 2988).

**6.839.3.10** `virtual Pointer<Response> activemq::transport::Transport::request ( const Pointer< Command > & command, unsigned int timeout ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException ) [pure virtual]`

Sends the given command to the broker and then waits for the response.

**Parameters**

<i>command</i>	- The command to be sent.
<i>timeout</i>	- The time to wait for this response.

**Returns**

the response from the broker.

**Exceptions**

<i>IOException</i>	if an exception occurs during the read of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3387), **activemq::transport::failover::FailoverTransport** (p. 1939), **activemq::transport::IOTransport** (p. 2218), **activemq::transport::logging::LoggingTransport** (p. 2479), **activemq::transport::mock::MockTransport** (p. 2861), **activemq::transport::TransportFilter** (p. 4011), and **activemq::wireformat::openwire::OpenWireFormatNeg** (p. 2989).

**6.839.3.11** `virtual void activemq::transport::Transport::setTransportListener ( TransportListener * listener ) [pure virtual]`

Sets the observer of asynchronous events from this transport.

**Parameters**

<i>listener</i>	the listener of transport events.
-----------------	-----------------------------------

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1941), `activemq::transport::IOTransport` (p. 2219), `activemq::transport::mock::MockTransport` (p. 2863), and `activemq::transport::TransportFilter` (p. 4012).

**6.839.3.12** `virtual void activemq::transport::Transport::setWireFormat ( const Pointer< wireformat::WireFormat > & wireFormat ) [pure virtual]`

Sets the `WireFormat` instance to use.

#### Parameters

<i>wireFormat</i>	The <code>WireFormat</code> the object used to encode / decode commands.
-------------------	--

Implemented in `activemq::transport::IOTransport` (p. 2220), and `activemq::transport::TransportFilter` (p. 4012).

**6.839.3.13** `virtual void activemq::transport::Transport::start ( ) throw ( decaf::io::IOException ) [pure virtual]`

Starts the **Transport** (p. 3996), the send methods of a **Transport** (p. 3996) will throw an exception if used before the **Transport** (p. 3996) is started.

#### Exceptions

<i>IOException</i>	if an error occurs while starting the <b>Transport</b> (p. 3996).
--------------------	---

Implemented in `activemq::transport::correlator::ResponseCorrelator` (p. 3388), `activemq::transport::failover::FailoverTransport` (p. 1942), `activemq::transport::IOTransport` (p. 2220), `activemq::transport::mock::MockTransport` (p. 2863), `activemq::transport::TransportFilter` (p. 4012), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2989).

**6.839.3.14** `virtual void activemq::transport::Transport::stop ( ) throw ( decaf::io::IOException ) [pure virtual]`

Stops the **Transport** (p. 3996).

#### Exceptions

<i>IOException</i>	if an error occurs while stopping the transport.
--------------------	--

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1942), `activemq::transport::IOTransport` (p. 2220), `activemq::transport::mock::MockTransport` (p. 2864), and `activemq::transport::TransportFilter` (p. 4012).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/Transport.h`

## 6.840 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

```
#include <src/main/activemq/transport/TransportFactory.h>
```

Inheritance diagram for activemq::transport::TransportFactory:

### Public Member Functions

- virtual **~TransportFactory** ()
- virtual **Pointer< Transport > create** (const **decaf::net::URI** &location)=0 throw ( exceptions::ActiveMQException )
 

*Creates a fully configured **Transport** (p. 3996) instance which could be a chain of filters and transports.*
- virtual **Pointer< Transport > createComposite** (const **decaf::net::URI** &location)=0 throw ( exceptions::ActiveMQException )
 

*Creates a slimed down **Transport** (p. 3996) instance which can be used in composite transport instances.*

### 6.840.1 Detailed Description

Defines the interface for Factories that create Transports or TransportFilters. The factory should be able to create either a completely configured **Transport** (p. 3996) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since

3.0

### 6.840.2 Constructor & Destructor Documentation

6.840.2.1 **virtual activemq::transport::TransportFactory::~TransportFactory** ( ) [inline, virtual]

### 6.840.3 Member Function Documentation

6.840.3.1 **virtual Pointer<Transport> activemq::transport::TransportFactory::create** ( const **decaf::net::URI** & location ) throw ( exceptions::ActiveMQException ) [pure virtual]

Creates a fully configured **Transport** (p. 3996) instance which could be a chain of filters and transports.

**Parameters**

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

**Exceptions**

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1944), **activemq::transport::mock::MockTransportFactory** (p. 2865), and **activemq::transport::tcp::TcpTransportFactory** (p. 3870).

**6.840.3.2** `virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite ( const decaf::net::URI & location ) throw ( exceptions::ActiveMQException )`  
[pure virtual]

Creates a slimmed down **Transport** (p. 3996) instance which can be used in composite transport instances.

**Parameters**

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

**Exceptions**

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1944), **activemq::transport::mock::MockTransportFactory** (p. 2865), and **activemq::transport::tcp::TcpTransportFactory** (p. 3870).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFactory.h`

**6.841 activemq::transport::TransportFilter Class Reference**

A filter on the transport layer.

```
#include <src/main/activemq/transport/TransportFilter.h>
```

*Listener of this transport.*

#### 6.841.1 Detailed Description

A filter on the transport layer. **Transport** (p. 3996) filters implement the **Transport** (p. 3996) interface and optionally delegate calls to another **Transport** (p. 3996) object.

Since

1.0

## 6.841.2 Constructor & Destructor Documentation

**6.841.2.1** `activemq::transport::TransportFilter::TransportFilter ( const Pointer< Transport > & next )`

Constructor.

### Parameters

<i>next</i>	- the next <b>Transport</b> (p. 3996) in the chain
-------------	--

**6.841.2.2** `virtual activemq::transport::TransportFilter::~~TransportFilter ( ) [inline, virtual]`

## 6.841.3 Member Function Documentation

**6.841.3.1** `virtual void activemq::transport::TransportFilter::close ( ) throw ( decaf::io::IOException ) [virtual]`

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

### Exceptions

<i>IOException</i>	if an error occurs while closing the <b>Transport</b> (p. 3996).
--------------------	--

Implements **decaf::io::Closeable** (p. 1181).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3386), **activemq::transport::inactivity::InactivityMonitor** (p. 2067), **activemq::transport::tcp::TcpTransport** (p. 3867), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2987).

**6.841.3.2** `void activemq::transport::TransportFilter::fire ( const Pointer< Command > & command ) [protected]`

Notify the listener of the new incoming Command.

### Parameters

<i>command</i>	- the command to send to the listener
----------------	---------------------------------------

**6.841.3.3** `void activemq::transport::TransportFilter::fire ( const decaf::lang::Exception & ex ) [protected]`

Notify the listener of the thrown Exception.

#### Parameters

<i>ex</i>	- the exception to send to listeners
-----------	--------------------------------------

**6.841.3.4** `virtual std::string activemq::transport::TransportFilter::getRemoteAddress ( ) const [inline, virtual]`

#### Returns

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3998).

**6.841.3.5** `virtual TransportListener* activemq::transport::TransportFilter::getTransportListener ( ) const [inline, virtual]`

Gets the observer of asynchronous exceptions from this transport.

#### Returns

The listener of transport events.

Implements **activemq::transport::Transport** (p. 3998).

**6.841.3.6** `virtual bool activemq::transport::TransportFilter::isClosed ( ) const [inline, virtual]`

Has the **Transport** (p. 3996) been shutdown and no longer usable.

#### Returns

true if the **Transport** (p. 3996)

Implements **activemq::transport::Transport** (p. 3998).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3868).

**6.841.3.7** `virtual bool activemq::transport::TransportFilter::isConnected ( ) const [inline, virtual]`

Is the **Transport** (p. 3996) Connected to its Broker.

**Returns**

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3998).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3868).

**6.841.3.8** `virtual bool activemq::transport::TransportFilter::isFaultTolerant ( ) const`  
`[inline, virtual]`

Is this **Transport** (p. 3996) fault tolerant, meaning that it will reconnect to a broker on disconnect.

**Returns**

true if the **Transport** (p. 3996) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3999).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3868).

References `activemq::transport::Transport::isFaultTolerant()`.

**6.841.3.9** `virtual Transport* activemq::transport::TransportFilter::narrow ( const`  
`std::type_info & typeId ) [virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3996) to allow a higher level transport to skip intermediate Transports in certain circumstances.

**Parameters**

<i>typeId</i>	- The type_info of the Object we are searching for.
---------------	---

**Returns**

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3999).

**6.841.3.10** `virtual void activemq::transport::TransportFilter::onCommand ( const Pointer<`  
`Command > & command ) [virtual]`

Event handler for the receipt of a command.

**Parameters**

<i>command</i>	- the received command object.
----------------	--------------------------------

Implements **activemq::transport::TransportListener** (p. 4014).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3386), **activemq::transport::inactivity::InactivityMonitor** (p. 2067), **activemq::transport::logging::LoggingTransport** (p. 2478), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2987).

**6.841.3.11** `virtual void activemq::transport::TransportFilter::oneway ( const Pointer< Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )`  
[inline, virtual]

Sends a one-way command.

Does not wait for any response from the broker.

#### Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

#### Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3999).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3386), **activemq::transport::inactivity::InactivityMonitor** (p. 2068), **activemq::transport::logging::LoggingTransport** (p. 2479), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2987).

**6.841.3.12** `virtual void activemq::transport::TransportFilter::onException ( const decaf::lang::Exception & ex )` [virtual]

Event handler for an exception from a command transport.

#### Parameters

<i>ex</i>	The exception to handle.
-----------	--------------------------

Implements **activemq::transport::TransportListener** (p. 4015).

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 2068).

**6.841.3.13** `virtual void activemq::transport::TransportFilter::reconnect ( const decaf::net::URI & uri ) throw ( decaf::io::IOException )` [virtual]

reconnect to another location

#### Parameters

<i>uri</i>	
------------	--

## Exceptions

<i>IOException</i>	on failure of if not supported
--------------------	--------------------------------

Implements **activemq::transport::Transport** (p. 4000).

**6.841.3.14** `virtual Pointer<Response> activemq::transport::TransportFilter::request ( const Pointer< Command > & command, unsigned int timeout ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )`  
[inline, virtual]

Not supported by this class - throws an exception.

## Parameters

<i>command</i>	- The command that is sent as a request
<i>timeout</i>	- The the time to wait for a response.

## Exceptions

<i>IOException</i>	
<i>UnsupportedOperation Exception.</i>	

Implements **activemq::transport::Transport** (p. 4001).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3387), **activemq::transport::logging::LoggingTransport** (p. 2479), and **activemq::wireformat::openwire::OpenWireFormatN** (p. 2989).

**6.841.3.15** `virtual Pointer<Response> activemq::transport::TransportFilter::request ( const Pointer< Command > & command ) throw ( decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException )`  
[inline, virtual]

Not supported by this class - throws an exception.

## Parameters

<i>command</i>	the command that is sent as a request
----------------	---------------------------------------

## Exceptions

<i>IOException</i>	
<i>UnsupportedOperation Exception.</i>	

Implements **activemq::transport::Transport** (p. 4000).

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 3387), `activemq::transport::logging::LoggingTransport` (p. 2479), and `activemq::wireformat::openwire::OpenWireFormat` (p. 2988).

**6.841.3.16** `virtual void activemq::transport::TransportFilter::setTransportListener ( TransportListener * listener ) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

#### Parameters

<i>listener</i>	the listener of transport events.
-----------------	-----------------------------------

Implements `activemq::transport::Transport` (p. 4001).

**6.841.3.17** `virtual void activemq::transport::TransportFilter::setWireFormat ( const Pointer< wireformat::WireFormat > & wireFormat ) [inline, virtual]`

Sets the WireFormat instance to use.

#### Parameters

<i>wireFormat</i>	The WireFormat the object used to encode / decode commands.
-------------------	---

Implements `activemq::transport::Transport` (p. 4002).

**6.841.3.18** `virtual void activemq::transport::TransportFilter::start ( ) throw ( decaf::io::IOException ) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

#### Exceptions

<i>IOException</i>	if an error occurs or if this transport has already been closed.
--------------------	--

Implements `activemq::transport::Transport` (p. 4002).

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 3388), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2989).

**6.841.3.19** `virtual void activemq::transport::TransportFilter::stop ( ) throw ( decaf::io::IOException ) [virtual]`

Stops the `Transport` (p. 3996).

**Exceptions**

<i>IOException</i>	if an error occurs while stopping the <b>Transport</b> (p. 3996).
--------------------	---

Implements **activemq::transport::Transport** (p. 4002).

**6.841.3.20** `virtual void activemq::transport::TransportFilter::transportInterrupted ( )`  
[virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 4015).

**6.841.3.21** `virtual void activemq::transport::TransportFilter::transportResumed ( )`  
[virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 4015).

**6.841.4 Field Documentation**

**6.841.4.1** `TransportListener* activemq::transport::TransportFilter::listener`  
[protected]

Listener of this transport.

**6.841.4.2** `Pointer<Transport> activemq::transport::TransportFilter::next`  
[protected]

The transport that this filter wraps around.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFilter.h`

**6.842 activemq::transport::TransportListener Class Reference**

A listener of asynchronous exceptions from a command transport object.

```
#include <src/main/activemq/transport/TransportListener.h>
```

Inheritance diagram for `activemq::transport::TransportListener`:

## Public Member Functions

- virtual `~TransportListener ()`
- virtual void `onCommand (const Pointer< Command > &command)=0`  
*Event handler for the receipt of a command.*
- virtual void `onException (const decaf::lang::Exception &ex)=0`  
*Event handler for an exception from a command transport.*

*The transport has suffered an interruption from which it hopes to recover.*
- virtual void `transportResumed ()=0`  
*The transport has resumed after an interruption.*

### 6.842.1 Detailed Description

A listener of asynchronous exceptions from a command transport object.

### 6.842.2 Constructor & Destructor Documentation

6.842.2.1 virtual `activemq::transport::TransportListener::~~TransportListener ( )`  
`[inline, virtual]`

### 6.842.3 Member Function Documentation

6.842.3.1 virtual void `activemq::transport::TransportListener::onCommand ( const Pointer< Command > & command )` `[pure virtual]`

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3996) deletes the command upon receipt.

#### Parameters

<i>command</i>	the received command object.
----------------	------------------------------

Implemented in `activemq::core::ActiveMQConnection` (p. 274), `activemq::transport::correlator::Response` (p. 3386), `activemq::transport::failover::FailoverTransportListener` (p. 1946), `activemq::transport::inactivity::InactivityMonitor` (p. 2067), `activemq::transport::logging::LoggingTransport` (p. 2478), `activemq::transport::mock::InternalCommandListener` (p. 2193), `activemq::transport::TransportFilter` (p. 4009), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2987).

**6.842.3.2** `virtual void activemq::transport::TransportListener::onException ( const decaf::lang::Exception & ex ) [pure virtual]`

Event handler for an exception from a command transport.

#### Parameters

<i>ex</i>	The exception being propagated to this listener to handle.
-----------	--

Implemented in **activemq::core::ActiveMQConnection** (p. 275), **activemq::transport::failover::BackupTransport** (p. 760), **activemq::transport::failover::FailoverTransportListener** (p. 1946), **activemq::transport::inactivity::InactivityMonitor** (p. 2068), and **activemq::transport::TransportFilter** (p. 4010).

**6.842.3.3** `virtual void activemq::transport::TransportListener::transportInterrupted ( ) [pure virtual]`

The transport has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 281), **activemq::transport::DefaultTransportListener** (p. 1758), **activemq::transport::failover::FailoverTransportListener** (p. 1947), and **activemq::transport::TransportFilter** (p. 4013).

**6.842.3.4** `virtual void activemq::transport::TransportListener::transportResumed ( ) [pure virtual]`

The transport has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnection** (p. 281), **activemq::transport::DefaultTransportListener** (p. 1758), **activemq::transport::failover::FailoverTransportListener** (p. 1947), and **activemq::transport::TransportFilter** (p. 4013).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportListener.h`

## 6.843 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 3996) Factories that are available to the client at runtime.

```
#include <src/main/activemq/transport/TransportRegistry.h>
```

### Public Member Functions

- `virtual ~TransportRegistry ()`
- `TransportFactory * findFactory (const std::string &name) const throw ( decaf::lang::exceptions::NoSuchElementException )`

*Gets a Registered **TransportFactory** (p. 4003) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **TransportFactory** \*factory) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException )

*Registers a new **TransportFactory** (p. 4003) with this Registry.*

- void **unregisterFactory** (const std::string &name)

*Unregisters the Factory with the given name and deletes that instance of the Factory.*

- std::vector< std::string > **getTransportNames** () const

*Retrieves a list of the names of all the Registered Transport's in this Registry.*

## Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

*Gets the single instance of the **TransportRegistry** (p. 4015).*

## 6.843.1 Detailed Description

Registry of all **Transport** (p. 3996) Factories that are available to the client at runtime. New Transport's must have a factory registered here before a connection attempt is made.

Since

3.0

## 6.843.2 Constructor & Destructor Documentation

- 6.843.2.1 virtual activemq::transport::TransportRegistry::~TransportRegistry ( )  
[virtual]

## 6.843.3 Member Function Documentation

- 6.843.3.1 **TransportFactory\*** activemq::transport::TransportRegistry::findFactory  
( const std::string & name ) const throw ( de-  
caf::lang::exceptions::NoSuchElementException  
)

Gets a Registered **TransportFactory** (p. 4003) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

<i>name</i>	The name of the Factory to find in the Registry.
-------------	--

**Returns**

the Factory registered under the given name.

**Exceptions**

<i>NoSuchElementException</i>	if no factory is registered with that name.
-------------------------------	---

**6.843.3.2** `static TransportRegistry& activemq::transport::TransportRegistry::getInstance ( ) [static]`

Gets the single instance of the **TransportRegistry** (p. 4015).

**Returns**

reference to the single instance of this Registry

**6.843.3.3** `std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames ( ) const`

Retrieves a list of the names of all the Registered Transport's in this Registry.

**Returns**

stl vector of strings with all the **Transport** (p. 3996) names registered.

**6.843.3.4** `void activemq::transport::TransportRegistry::registerFactory ( const std::string & name, TransportFactory * factory ) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException )`

Registers a new **TransportFactory** (p. 4003) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

**Parameters**

<i>name</i>	The name of the new Factory to register.
<i>factory</i>	The new Factory to add to the Registry.

**Exceptions**

<i>IllegalArgumentException</i>	is name is the empty string.
<i>NullPointerException</i>	if the Factory is Null.

**6.843.3.5** void activemq::transport::TransportRegistry::unregisterFactory ( const std::string & name )

Unregisters the Factory with the given name and deletes that instance of the Factory.

**Parameters**

<i>name</i>	Name of the Factory to unregister and destroy
-------------	---

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportRegistry.h**

**6.844 tree\_desc\_s Struct Reference**

```
#include <src/main/decaf/internal/util/zip/deflate.h>
```

**Data Fields**

- ct\_data \* dyn\_tree
- int max\_code
- static\_tree\_desc \* stat\_desc

**6.844.1 Field Documentation**

**6.844.1.1** ct\_data\* tree\_desc\_s::dyn\_tree

**6.844.1.2** int tree\_desc\_s::max\_code

**6.844.1.3** static\_tree\_desc\* tree\_desc\_s::stat\_desc

The documentation for this struct was generated from the following file:

- src/main/decaf/internal/util/zip/**deflate.h**

## 6.845 decaf::lang::Thread::UncaughtExceptionHandler Class Reference

Interface for handlers invoked when a **Thread** (p. 3876) abruptly terminates due to an uncaught exception.

```
#include <src/main/decaf/lang/Thread.h>
```

### Public Member Functions

- virtual **~UncaughtExceptionHandler** ()
- virtual void **uncaughtException** (const **Thread** \*thread, const **Throwable** &error)=0 throw ()

*Method invoked when the given thread terminates due to the given uncaught exception.*

#### 6.845.1 Detailed Description

Interface for handlers invoked when a **Thread** (p. 3876) abruptly terminates due to an uncaught exception.

#### 6.845.2 Constructor & Destructor Documentation

6.845.2.1 virtual decaf::lang::Thread::UncaughtExceptionHandler::~~UncaughtExceptionHandler ( ) [inline, virtual]

#### 6.845.3 Member Function Documentation

6.845.3.1 virtual void decaf::lang::Thread::UncaughtExceptionHandler::uncaughtException ( const **Thread** \* thread, const **Throwable** & error ) throw () [pure virtual]

Method invoked when the given thread terminates due to the given uncaught exception.

This method is defined to indicate that it will not throw an exception, throwing and exception from this method will on most systems result in a segmentation fault.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Thread.h**

## 6.846 decaf::net::UnknownHostException Class Reference

```
#include <src/main/decaf/net/UnknownHostException.h>
```

Inheritance diagram for decaf::net::UnknownHostException:

## Public Member Functions

- **UnknownHostException** () throw ()  
*Default Constructor.*
- **UnknownHostException** (const Exception &ex) throw ()  
*Conversion Constructor from some other Exception.*
- **UnknownHostException** (const **UnknownHostException** &ex) throw ()  
*Copy Constructor.*
- **UnknownHostException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **UnknownHostException** (const std::exception \*cause) throw ()  
*Constructor.*
- **UnknownHostException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- virtual **UnknownHostException** \* clone () const  
*Clones this exception.*
- virtual ~**UnknownHostException** () throw ()

## 6.846.1 Constructor & Destructor Documentation

6.846.1.1 decaf::net::UnknownHostException::UnknownHostException ( ) throw ()  
[inline]

Default Constructor.

6.846.1.2 decaf::net::UnknownHostException::UnknownHostException ( const Exception & ex )  
throw () [inline]

Conversion Constructor from some other Exception.

### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.846.1.3** decaf::net::UnknownHostException::UnknownHostException ( const  
UnknownHostException & ex ) throw () [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.846.1.4** decaf::net::UnknownHostException::UnknownHostException ( const char \* *file*,  
const int *lineNumber*, const std::exception \* *cause*, const char \* *msg*, ... ) throw ()  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.846.1.5** decaf::net::UnknownHostException::UnknownHostException ( const std::exception \*  
*cause* ) throw () [inline]

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.846.1.6** decaf::net::UnknownHostException::UnknownHostException ( const char \* *file*,  
const int *lineNumber*, const char \* *msg*, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.846.1.7 `virtual decaf::net::UnknownHostException::~~UnknownHostException ( ) throw ()`  
`[inline, virtual]`

## 6.846.2 Member Function Documentation

6.846.2.1 `virtual UnknownHostException* decaf::net::UnknownHostException::clone ( )`  
`const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 2212).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownHostException.h`

## 6.847 decaf::net::UnknownServiceException Class Reference

```
#include <src/main/decaf/net/UnknownServiceException.h>
```

Inheritance diagram for `decaf::net::UnknownServiceException`:

### Public Member Functions

- **UnknownServiceException** ( ) throw ()  
*Default Constructor.*
- **UnknownServiceException** (const Exception &ex) throw ()  
*Conversion Constructor from some other Exception.*
- **UnknownServiceException** (const UnknownServiceException &ex) throw ()  
*Copy Constructor.*
- **UnknownServiceException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **UnknownServiceException** (const std::exception \*cause) throw ()

*Constructor.*

- **UnknownServiceException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- virtual **UnknownServiceException \* clone** () const  
*Clones this exception.*
- virtual ~**UnknownServiceException** () throw ()

### 6.847.1 Constructor & Destructor Documentation

**6.847.1.1 decaf::net::UnknownServiceException::UnknownServiceException ( ) throw ()**  
[inline]

Default Constructor.

**6.847.1.2 decaf::net::UnknownServiceException::UnknownServiceException ( const Exception & ex ) throw ()** [inline]

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.847.1.3 decaf::net::UnknownServiceException::UnknownServiceException ( const UnknownServiceException & ex ) throw ()** [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.847.1.4 decaf::net::UnknownServiceException::UnknownServiceException ( const char \* file, const int lineNumber, const std::exception \* cause, const char \* msg, ... ) throw ()**  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.847.1.5** `decaf::net::UnknownServiceException::UnknownServiceException ( const std::exception * cause ) throw () [inline]`

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.847.1.6** `decaf::net::UnknownServiceException::UnknownServiceException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.847.1.7** `virtual decaf::net::UnknownServiceException::~UnknownServiceException ( ) throw () [inline, virtual]`

## 6.847.2 Member Function Documentation

**6.847.2.1** `virtual UnknownServiceException* decaf::net::UnknownServiceException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 2212).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownServiceException.h`

## 6.848 `decaf::io::UnsupportedEncodingException` Class Reference

Thrown when the the Character Encoding is not supported.

```
#include <src/main/decaf/io/UnsupportedEncodingException.h>
```

Inheritance diagram for `decaf::io::UnsupportedEncodingException`:

### Public Member Functions

- **`UnsupportedEncodingException () throw ()`**  
*Default Constructor.*
- **`UnsupportedEncodingException (const lang::Exception &ex) throw ()`**  
*Copy Constructor.*
- **`UnsupportedEncodingException (const UnsupportedEncodingException &ex) throw ()`**  
*Copy Constructor.*
- **`UnsupportedEncodingException (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()`**  
*Constructor - Initializes the file name and line number where this message occurred.*
- **`UnsupportedEncodingException (const std::exception *cause) throw ()`**  
*Constructor.*
- **`UnsupportedEncodingException (const char *file, const int lineNumber, const char *msg,...) throw ()`**  
*Constructor.*
- **`virtual UnsupportedEncodingException * clone () const`**  
*Clones this exception.*
- **`virtual ~UnsupportedEncodingException () throw ()`**

### 6.848.1 Detailed Description

Thrown when the the Character Encoding is not supported.

Since

1.0

### 6.848.2 Constructor & Destructor Documentation

**6.848.2.1** `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( )  
throw ()` `[inline]`

Default Constructor.

**6.848.2.2** `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( const  
lang::Exception & ex ) throw ()` `[inline]`

Copy Constructor.

#### Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

**6.848.2.3** `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( const  
UnsupportedEncodingException & ex ) throw ()` `[inline]`

Copy Constructor.

#### Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

**6.848.2.4** `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( const  
char * file, const int lineNumber, const std::exception * cause, const char * msg, ...  
) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.848.2.5** `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( const std::exception * cause ) throw () [inline]`

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.848.2.6** `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( const char * file, const int lineNumber, const char * msg, ... ) throw () [inline]`

Constructor.

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.848.2.7** `virtual decaf::io::UnsupportedEncodingException::~~UnsupportedEncodingException ( ) throw () [inline, virtual]`

### 6.848.3 Member Function Documentation

**6.848.3.1** `virtual UnsupportedEncodingException* decaf::io::UnsupportedEncodingException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 2212).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/UnsupportedEncodingException.h`

## 6.849 decaf::lang::exceptions::UnsupportedOperationException Class Reference

```
#include <src/main/decaf/lang/exceptions/UnsupportedOperationException.h>
```

Inheritance diagram for decaf::lang::exceptions::UnsupportedOperationException:

### Public Member Functions

- **UnsupportedOperationException** () throw ()  
*Default Constructor.*
- **UnsupportedOperationException** (const **Exception** &ex) throw ()  
*Conversion Constructor from some other **Exception** (p. 1886).*
- **UnsupportedOperationException** (const **UnsupportedOperationException** &ex) throw ()  
*Copy Constructor.*
- **UnsupportedOperationException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **UnsupportedOperationException** (const std::exception \*cause) throw ()  
*Constructor.*
- **UnsupportedOperationException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- virtual **UnsupportedOperationException** \* **clone** () const  
*Clones this exception.*
- virtual ~**UnsupportedOperationException** () throw ()

### 6.849.1 Constructor & Destructor Documentation

6.849.1.1 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException ( ) throw () [inline]

Default Constructor.

## 6.849 decaf::lang::exceptions::UnsupportedOperationException Class Reference

6.849.1.2 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException  
( const Exception & ex ) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1886).

### Parameters

<i>ex</i>	An exception that should become this type of <b>Exception</b> (p. 1886)
-----------	---

6.849.1.3 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException  
( const UnsupportedOperationException & ex ) throw () [inline]

Copy Constructor.

### Parameters

<i>ex</i>	An exception that should become this type of <b>Exception</b> (p. 1886)
-----------	---

6.849.1.4 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException  
( const char \* file, const int lineNumber, const std::exception \* cause, const char \*  
msg, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.849.1.5 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException  
( const std::exception \* cause ) throw () [inline]

Constructor.

### Parameters

<i>cause</i>	<b>Pointer</b> (p. 3032) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	---

**6.849.1.6** `decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException`  
`( const char * file, const int lineNumber, const char * msg, ... ) throw ()`  
`[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.849.1.7** `virtual decaf::lang::exceptions::UnsupportedOperationException::~UnsupportedOperationException`  
`( ) throw () [inline, virtual]`

## 6.849.2 Member Function Documentation

**6.849.2.1** `virtual UnsupportedOperationException*`  
`decaf::lang::exceptions::UnsupportedOperationException::clone ( ) const`  
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

an new **Exception** (p. 1886) instance that is a copy of this one.

Reimplemented from `decaf::lang::Exception` (p. 1889).

Reimplemented in `decaf::nio::ReadOnlyBufferException` (p. 3263).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/UnsupportedOperationException.h`

## 6.850 cms::UnsupportedOperationException Class Reference

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

```
#include <src/main/cms/UnsupportedOperationException.h>
```

Inheritance diagram for `cms::UnsupportedOperationException`:

## Public Member Functions

- **UnsupportedOperationException** () throw ()
- **UnsupportedOperationException** (const **UnsupportedOperationException** &ex) throw ()
- **UnsupportedOperationException** (const std::string &message, const std::exception \*cause) throw ()
- **UnsupportedOperationException** (const std::string &message, const std::exception \*cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**UnsupportedOperationException** () throw ()

### 6.850.1 Detailed Description

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Since

2.0

### 6.850.2 Constructor & Destructor Documentation

- 6.850.2.1 **cms::UnsupportedOperationException::UnsupportedOperationException** ( ) throw ()
- 6.850.2.2 **cms::UnsupportedOperationException::UnsupportedOperationException** ( const **UnsupportedOperationException** & ex ) throw ()
- 6.850.2.3 **cms::UnsupportedOperationException::UnsupportedOperationException** ( const std::string & message, const std::exception \* cause ) throw ()
- 6.850.2.4 **cms::UnsupportedOperationException::UnsupportedOperationException** ( const std::string & message, const std::exception \* cause, const std::vector< std::pair< std::string, int > > & stackTrace ) throw ()
- 6.850.2.5 virtual **cms::UnsupportedOperationException::~~UnsupportedOperationException** ( ) throw () [virtual]

The documentation for this class was generated from the following file:

- src/main/cms/**UnsupportedOperationException.h**

## 6.851 decaf::net::URI Class Reference

This class represents an instance of a **URI** (p. 4031) as defined by RFC 2396.

```
#include <src/main/decaf/net/URI.h>
```

Inheritance diagram for decaf::net::URI:

## Public Member Functions

- **URI** ()  
*Default Constructor; same as calling a Constructor with all fields empty.*
- **URI** (const **URI** &uri) throw ( URISyntaxException )  
*Constructs a **URI** (p. 4031) as a copy of another **URI** (p. 4031).*
- **URI** (const std::string &uri) throw ( URISyntaxException )  
*Constructs a **URI** (p. 4031) from the given string.*
- **URI** (const std::string &scheme, const std::string &ssp, const std::string &fragment) throw ( URISyntaxException )  
*Constructs a **URI** (p. 4031) from the given components.*
- **URI** (const std::string &scheme, const std::string &userInfo, const std::string &host, int port, const std::string &path, const std::string &query, const std::string &fragment) throw ( URISyntaxException )  
*Constructs a **URI** (p. 4031) from the given components.*
- **URI** (const std::string &scheme, const std::string &host, const std::string &path, const std::string &fragment) throw ( URISyntaxException )  
*Constructs a **URI** (p. 4031) from the given components.*
- **URI** (const std::string &scheme, const std::string &authority, const std::string &path, const std::string &query, const std::string &fragment) throw ( URISyntaxException )  
*Constructs a **URI** (p. 4031) from the given components.*
- virtual ~**URI** ()

*Compares this object with the specified object for order.*
- virtual bool **equals** (const **URI** &value) const
- virtual bool **operator==** (const **URI** &value) const  
*Compares equality between this object and the one passed.*
- virtual bool **operator<** (const **URI** &value) const  
*Compares this object to another and returns true if this object is considered to be less than the one passed.*
- std::string **getAuthority** () const

- std::string **getFragment** () const
- std::string **getHost** () const
- std::string **getPath** () const
- int **getPort** () const
- std::string **getQuery** () const
- std::string **getScheme** () const
- std::string **getUserInfo** () const
- std::string **getRawAuthority** () const
  - Returns the raw authority component of this **URI** (p. 4031).*
- std::string **getRawFragment** () const
  - Returns the raw fragment component of this **URI** (p. 4031).*
- std::string **getRawPath** () const
  - Returns the raw path component of this **URI** (p. 4031).*
- std::string **getRawQuery** () const
  - Returns the raw query component of this **URI** (p. 4031).*
- std::string **getRawSchemeSpecificPart** () const
  - Returns the raw scheme-specific part of this **URI** (p. 4031).*
- std::string **getSchemeSpecificPart** () const
  - Returns the decoded scheme-specific part of this **URI** (p. 4031).*
- std::string **getRawUserInfo** () const
  - Returns the raw user-information component of this **URI** (p. 4031).*
- bool **isAbsolute** () const
  - Tells whether or not this **URI** (p. 4031) is absolute.*
- bool **isOpaque** () const
  - Tells whether or not this **URI** (p. 4031) is opaque.*
- **URI normalize** () const
  - Normalizes this **URI**'s path.*
- **URI parseServerAuthority** () const throw ( URISyntaxException )
  - Attempts to parse this **URI**'s authority component, if defined, into user-information, host, and port components.*
- **URI relativize** (const **URI** &uri) const
  - Relativizes the given **URI** (p. 4031) against this **URI** (p. 4031).*
- **URI resolve** (const std::string &str) const throw ( lang::exceptions::IllegalArgumentException )

*Constructs a new **URI** (p. 4031) by parsing the given string and then resolving it against this **URI** (p. 4031).*

- **URI resolve** (const **URI** &uri) const

*Resolves the given **URI** (p. 4031) against this **URI** (p. 4031).*

- std::string **toString** () const

*Returns the content of this **URI** (p. 4031) as a string.*

- **URL toURL** () const throw ( MalformedURLException, lang::exceptions::IllegalArgumentException )

*Constructs a **URL** (p. 4072) from this **URI** (p. 4031).*

## Static Public Member Functions

- static **URI create** (const std::string uri) throw ( lang::exceptions::IllegalArgumentException )

*Creates a **URI** (p. 4031) by parsing the given string.*

## 6.851.1 Detailed Description

This class represents an instance of a **URI** (p. 4031) as defined by RFC 2396.

## 6.851.2 Constructor & Destructor Documentation

### 6.851.2.1 decaf::net::URI::URI ( )

Default Constructor, same as calling a Constructor with all fields empty.

### 6.851.2.2 decaf::net::URI::URI ( const **URI** & uri ) throw ( URISyntaxException )

Constructs a **URI** (p. 4031) as a copy of another **URI** (p. 4031).

## Parameters

<i>uri</i>	- uri to copy
------------	---------------

### 6.851.2.3 decaf::net::URI::URI ( const std::string & uri ) throw ( URISyntaxException )

Constructs a **URI** (p. 4031) from the given string.

**Parameters**

<i>uri</i>	- string uri to parse.
------------	------------------------

**6.851.2.4** decaf::net::URI::URI ( const std::string & *scheme*, const std::string & *ssp*, const std::string & *fragment* ) throw ( URISyntaxException )

Constructs a **URI** (p. 4031) from the given components.

**Parameters**

<i>scheme</i>	- the uri scheme
<i>ssp</i>	- Scheme specific part
<i>fragment</i>	- Fragment

**6.851.2.5** decaf::net::URI::URI ( const std::string & *scheme*, const std::string & *userInfo*, const std::string & *host*, int *port*, const std::string & *path*, const std::string & *query*, const std::string & *fragment* ) throw ( URISyntaxException )

Constructs a **URI** (p. 4031) from the given components.

**Parameters**

<i>scheme</i>	- Scheme name
<i>userInfo</i>	- User name and authorization information
<i>host</i>	- Host name
<i>port</i>	- Port number
<i>path</i>	- Path
<i>query</i>	- Query
<i>fragment</i>	- Fragment

**6.851.2.6** decaf::net::URI::URI ( const std::string & *scheme*, const std::string & *host*, const std::string & *path*, const std::string & *fragment* ) throw ( URISyntaxException )

Constructs a **URI** (p. 4031) from the given components.

**Parameters**

<i>scheme</i>	- Scheme name
<i>host</i>	- Host name
<i>path</i>	- Path
<i>fragment</i>	- Fragment

**6.851.2.7** `decaf::net::URI::URI ( const std::string & scheme, const std::string & authority, const std::string & path, const std::string & query, const std::string & fragment ) throw ( URISyntaxException )`

Constructs a **URI** (p. 4031) from the given components.

#### Parameters

<i>scheme</i>	- Scheme name
<i>authority</i>	- Authority
<i>path</i>	- Path
<i>query</i>	- Query
<i>fragment</i>	- Fragment

**6.851.2.8** `virtual decaf::net::URI::~~URI ( ) [inline, virtual]`

### 6.851.3 Member Function Documentation

**6.851.3.1** `virtual int decaf::net::URI::compareTo ( const URI & value ) const [virtual]`

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

#### Parameters

<i>value</i>	- the value to compare to this one.
--------------	-------------------------------------

#### Returns

zero if equal minus one if less than and one if greater than.

**6.851.3.2** `static URI decaf::net::URI::create ( const std::string uri ) throw ( lang::exceptions::IllegalArgumentException ) [static]`

Creates a **URI** (p. 4031) by parsing the given string.

This convenience factory method works as if by invoking the `URI(string)` constructor; any **URISyntaxException** (p. 4060) thrown by the constructor is caught and wrapped in a new `IllegalArgumentException` object, which is then thrown.

#### Parameters

<i>uri</i>	- <b>URI</b> (p. 4031) string to parse
------------	--

#### Exceptions

<i>IllegalArgumentException</i>	
---------------------------------	--

**6.851.3.3** virtual bool decaf::net::URI::equals ( const URI & *value* ) const [virtual]

**Returns**

true if this value is considered equal to the passed value.

**6.851.3.4** std::string decaf::net::URI::getAuthority ( ) const

**Returns**

the decoded authority component of this **URI** (p. 4031).

**6.851.3.5** std::string decaf::net::URI::getFragment ( ) const

**Returns**

the decoded fragment component of this **URI** (p. 4031).

**6.851.3.6** std::string decaf::net::URI::getHost ( ) const

**Returns**

the host component of this **URI** (p. 4031).

**6.851.3.7** std::string decaf::net::URI::getPath ( ) const

**Returns**

the path component of this **URI** (p. 4031).

**6.851.3.8** int decaf::net::URI::getPort ( ) const

**Returns**

the port component of this **URI** (p. 4031).

**6.851.3.9** std::string decaf::net::URI::getQuery ( ) const

**Returns**

the query component of this **URI** (p. 4031).

**6.851.3.10** `std::string decaf::net::URI::getRawAuthority ( ) const`

Returns the raw authority component of this **URI** (p. 4031).

The authority component of a **URI** (p. 4031), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

**Returns**

the raw authority component of the **URI** (p. 4031)

**6.851.3.11** `std::string decaf::net::URI::getRawFragment ( ) const`

Returns the raw fragment component of this **URI** (p. 4031).

The fragment component of a **URI** (p. 4031), if defined, only contains legal **URI** (p. 4031) characters.

**Returns**

the raw fragment component of this **URI** (p. 4031)

**6.851.3.12** `std::string decaf::net::URI::getRawPath ( ) const`

Returns the raw path component of this **URI** (p. 4031).

The path component of a **URI** (p. 4031), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

**Returns**

the raw path component of this **URI** (p. 4031)

**6.851.3.13** `std::string decaf::net::URI::getRawQuery ( ) const`

Returns the raw query component of this **URI** (p. 4031).

The query component of a **URI** (p. 4031), if defined, only contains legal **URI** (p. 4031) characters.

**Returns**

the raw query component of the **URI** (p. 4031).

**6.851.3.14** `std::string decaf::net::URI::getRawSchemeSpecificPart ( ) const`

Returns the raw scheme-specific part of this **URI** (p. 4031).

The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 4031) only contains legal **URI** (p. 4031) characters.

**Returns**

the raw scheme special part of the uri

**6.851.3.15** `std::string decaf::net::URI::getRawUserInfo ( ) const`

Returns the raw user-information component of this **URI** (p. 4031).

The user-information component of a **URI** (p. 4031), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

**Returns**

the raw user-information component of the **URI** (p. 4031)

**6.851.3.16** `std::string decaf::net::URI::getScheme ( ) const`**Returns**

the scheme component of this **URI** (p. 4031)

**6.851.3.17** `std::string decaf::net::URI::getSchemeSpecificPart ( ) const`

Returns the decoded scheme-specific part of this **URI** (p. 4031).

The string returned by this method is equal to that returned by the `getRawSchemeSpecificPart` method except that all sequences of escaped octets are decoded.

**Returns**

the raw scheme specific part of the uri.

**6.851.3.18** `std::string decaf::net::URI::getUserInfo ( ) const`**Returns**

the user info component of this **URI** (p. 4031)

**6.851.3.19 bool decaf::net::URI::isAbsolute ( ) const**

Tells whether or not this **URI** (p. 4031) is absolute.

A **URI** (p. 4031) is absolute if, and only if, it has a scheme component.

**Returns**

true if, and only if, this **URI** (p. 4031) is absolute

**6.851.3.20 bool decaf::net::URI::isOpaque ( ) const**

Tells whether or not this **URI** (p. 4031) is opaque.

A **URI** (p. 4031) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 4031) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

**Returns**

true if, and only if, this **URI** (p. 4031) is opaque

**6.851.3.21 URI decaf::net::URI::normalize ( ) const**

Normalizes this **URI**'s path.

If this **URI** (p. 4031) is opaque, or if its path is already in normal form, then this **URI** (p. 4031) is returned. Otherwise a new **URI** (p. 4031) is constructed that is identical to this **URI** (p. 4031) except that its path is computed by normalizing this **URI**'s path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed. 2. If a ".." segment is preceded by a non-".." segment then both of these segments are removed. This step is repeated until it is no longer applicable. 3. If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 4031) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 4031) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more "." segments if there were insufficient non-".." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

**Returns**

A **URI** (p. 4031) equivalent to this **URI** (p. 4031), but whose path is in normal form

**6.851.3.22** `virtual bool decaf::net::URI::operator< ( const URI & value ) const`  
`[virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

#### Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

#### Returns

true if this object is equal to the one passed.

**6.851.3.23** `virtual bool decaf::net::URI::operator== ( const URI & value ) const`  
`[virtual]`

Compares equality between this object and the one passed.

#### Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

#### Returns

true if this object is equal to the one passed.

**6.851.3.24** `URI decaf::net::URI::parseServerAuthority ( ) const throw (`  
`URISyntaxException)`

Attempts to parse this URI's authority component, if defined, into user-information, host, and port components.

If this URI's authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p. 4031) has no authority component, this method simply returns this **URI** (p. 4031).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

#### Returns

A **URI** (p. 4031) whose authority field has been parsed as a server-based authority

#### Exceptions

<i><b>URISyntaxException</b></i> (p. 4060)	- If the authority component of this <b>URI</b> (p. 4031) is defined but cannot be parsed as a server-based authority.
---	--

**6.851.3.25 URI decaf::net::URI::relativize ( const URI & uri ) const**

Relativizes the given **URI** (p. 4031) against this **URI** (p. 4031).

The relativization of the given **URI** (p. 4031) against this **URI** (p. 4031) is computed as follows:

1. If either this **URI** (p. 4031) or the given **URI** (p. 4031) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 4031) is not a prefix of the path of the given **URI** (p. 4031), then the given **URI** (p. 4031) is returned.
2. Otherwise a new relative hierarchical **URI** (p. 4031) is constructed with query and fragment components taken from the given **URI** (p. 4031) and with a path component computed by removing this URI's path from the beginning of the given URI's path.

**Parameters**

<i>uri</i>	- The <b>URI</b> (p. 4031) to be relativized against this <b>URI</b> (p. 4031)
------------	--

**Returns**

The resulting **URI** (p. 4031)

**6.851.3.26 URI decaf::net::URI::resolve ( const std::string & str ) const throw ( lang::exceptions::IllegalArgumentException )**

Constructs a new **URI** (p. 4031) by parsing the given string and then resolving it against this **URI** (p. 4031).

This convenience method works as if invoking it were equivalent to evaluating the expression `resolve( URI::create( str ) )`.

**Parameters**

<i>str</i>	- The string to be parsed into a <b>URI</b> (p. 4031)
------------	---

**Returns**

The resulting **URI** (p. 4031)

**Exceptions**

<i>IllegalArgumentException</i>	- If the given string violates RFC 2396
---------------------------------	---

**6.851.3.27 URI decaf::net::URI::resolve ( const URI & uri ) const**

Resolves the given **URI** (p. 4031) against this **URI** (p. 4031).

If the given **URI** (p. 4031) is already absolute, or if this **URI** (p. 4031) is opaque, then a copy of the given **URI** (p. 4031) is returned.

If the given URI's fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 4031) with the given fragment but with all other components equal to those of this **URI** (p. 4031) is returned. This allows a **URI** (p. 4031) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 4031).

Otherwise this method constructs a new hierarchical **URI** (p. 4031) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 4031) is constructed with this URI's scheme and the given URI's query and fragment components.
2. If the given **URI** (p. 4031) has an authority component then the new URI's authority and path are taken from the given **URI** (p. 4031).
3. Otherwise the new URI's authority component is copied from this **URI** (p. 4031), and its path is computed as follows:

1. If the given URI's path is absolute then the new URI's path is taken from the given **URI** (p. 4031).
2. Otherwise the given URI's path is relative, and so the new URI's path is computed by resolving the path of the given **URI** (p. 4031) against the path of this **URI** (p. 4031). This is done by concatenating all but the last segment of this URI's path, if any, with the given URI's path and then normalizing the result as if by invoking the `normalize` method.

The result of this method is absolute if, and only if, either this **URI** (p. 4031) is absolute or the given **URI** (p. 4031) is absolute.

#### Parameters

<i>uri</i>	- The <b>URI</b> (p. 4031) to be resolved against this <b>URI</b> (p. 4031)
------------	---

#### Returns

The resulting **URI** (p. 4031)

#### 6.851.3.28 `std::string decaf::net::URI::toString ( ) const`

Returns the content of this **URI** (p. 4031) as a string.

If this **URI** (p. 4031) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 4031) was created by normalization, resolution, or relativization, and so a string is constructed from this URI's components according to the rules specified in RFC 2396, section 5.2, step 7.

#### Returns

the string form of this **URI** (p. 4031)

#### 6.851.3.29 `URL decaf::net::URI::toURL ( ) const throw ( MalformedURLException, lang::exceptions::IllegalArgumentException )`

Constructs a **URL** (p. 4072) from this **URI** (p. 4031).

This convenience method works as if invoking it were equivalent to evaluating the expression `new URL (p. 4072)(this.toString())` after first checking that this **URI** (p. 4031) is absolute.

### Returns

A **URL** (p. 4072) constructed from this **URI** (p. 4031)

### Exceptions

<i><b>IllegalArgumentEx- ception</b></i>	- If this <b>URL</b> (p. 4072) is not absolute
<i><b>MalformedURLEx- ception</b></i> (p. 2536)	- If a protocol handler for the <b>URL</b> (p. 4072) could not be found, or if some other error occurred while constructing the <b>URL</b> (p. 4072)

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URL.h`

6.852.1.1 **decaf::internal::net::URLEncoderDecoder::URLEncoderDecoder ( )**

6.852.1.2 **virtual decaf::internal::net::URLEncoderDecoder::~~URLEncoderDecoder ( )**  
[inline, virtual]

## 6.852.2 Member Function Documentation

6.852.2.1 **static std::string decaf::internal::net::URLEncoderDecoder::decode ( const std::string & s )** [static]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

” and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C \$%"

### Parameters

<i>s</i>	- The encoded string.
----------	-----------------------

### Returns

The decoded version.

6.852.2.2 **static std::string decaf::internal::net::URLEncoderDecoder::encodeOthers ( const std::string & s )** [static]

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

They are converted into their hexadecimal value prepended by ”.

For example: Euro currency symbol -> "%E2%82%AC".

### Parameters

<i>s</i>	- the string to be converted
----------	------------------------------

### Returns

the converted string

**6.852.2.3** `static std::string decaf::internal::net::URIEncoderDecoder::quotelllegal ( const std::string & s, const std::string & legal ) [static]`

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ".

For example: '#' -> 23

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

#### Parameters

<i>s</i>	- the string to be converted
<i>legal</i>	- the characters allowed to be preserved in the string s

#### Returns

converted string

**6.852.2.4** `static void decaf::internal::net::URIEncoderDecoder::validate ( const std::string & s, const std::string & legal ) throw ( decaf::net::URISyntaxException ) [static]`

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter
4. characters that are not ISO Control or are not ISO Space characters)

#### Parameters

<i>s</i>	- the string to be validated
<i>legal</i>	- the characters allowed in the string s

**6.852.2.5** `static void decaf::internal::net::URIEncoderDecoder::validateSimple ( const std::string & s, const std::string & legal ) throw ( decaf::net::URISyntaxException ) [static]`

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter

#### Parameters

<i>s</i>	- the string to be validated
<i>legal</i>	- the characters allowed in the string s

*Determines if the given char is a valid Hex char.*

### 6.853.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

### 6.853.2 Constructor & Destructor Documentation

- 6.853.2.1 decaf::internal::net::URIHelper::URIHelper ( const std::string & *unreserved*, const std::string & *punct*, const std::string & *reserved*, const std::string & *someLegal*, const std::string & *allLegal* )

Setup the **URIHelper** (p. 4047) with values assigned to the various fields that are used in the validation process.

The defaults are overridden by these values.

#### Parameters

<i>unreserved</i>	- characters not reserved for use.
-------------------	------------------------------------

<i>punct</i>	- allowable punctuation symbols.
<i>reserved</i>	- characters not allowed for general use in the URI.
<i>someLegal</i>	- characters that are legal in certain cases.
<i>allLegal</i>	- characters that are always legal.

### 6.853.2.2 decaf::internal::net::URIHelper::URIHelper ( )

Sets up the filter strings with sane defaults.

### 6.853.2.3 virtual decaf::internal::net::URIHelper::~~URIHelper ( ) [inline, virtual]

## 6.853.3 Member Function Documentation

### 6.853.3.1 bool decaf::internal::net::URIHelper::isValidDomainName ( const std::string & *host* )

Validates the string past to determine if it is a well formed domain name.

#### Parameters

<i>host</i>	- domain name to validate.
-------------	----------------------------

#### Returns

true if host is well formed.

### 6.853.3.2 bool decaf::internal::net::URIHelper::isValidHexChar ( char *c* )

Determines if the given char is a valid Hex char.

Valid chars are A-F (upper or lower case) and 0-9.

#### Parameters

<i>c</i>	- char to inspect
----------	-------------------

#### Returns

true if *c* is a valid hex char.

### 6.853.3.3 bool decaf::internal::net::URIHelper::isValidHost ( bool *forceServer*, const std::string & *host* ) throw ( decaf::net::URISyntaxException )

distinguish between IPv4, IPv6, domain name and validate it based on its type

#### Parameters

<i>forceServer</i>	- true if the forceServer mode should be active.
<i>host</i>	- Host string to validate.

**Returns**

true if the host value if a valid domain name.

**Exceptions**

<i>URISyntaxException</i>	if the host is invalid and forceServer is true.
---------------------------	---

**6.853.3.4 bool decaf::internal::net::URIHelper::isValidIP4Word ( const std::string & word )**

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

**Parameters**

<i>word</i>	- string value to check.
-------------	--------------------------

**Returns**

true if the word is a valid IPv4 word.

**6.853.3.5 bool decaf::internal::net::URIHelper::isValidIP6Address ( const std::string & ipAddress )**

Determines if the given address is valid according to the IPv6 spec.

**Parameters**

<i>ipAddress</i>	- string ip address value to validate.
------------------	--

**Returns**

true if the address string is valid.

**6.853.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address ( const std::string & host )**

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.

and XXX is not greater than 255.

**Parameters**

<i>host</i>	- IPv4 address string to parse.
-------------	---------------------------------

**Returns**

true if host is a well formed IPv4 address.

**6.853.3.7 URIType decaf::internal::net::URIHelper::parseAuthority ( bool *forceServer*, const std::string & *authority* ) throw ( decaf::net::URISyntaxException )**

determine the host, port and user-info if the authority parses successfully to a server based authority

behavior in error cases: if *forceServer* is true, throw URISyntaxException with the proper diagnostic messages. if *forceServer* is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the *forceServer* parameter e.g. mal-formed ipv6 address

**Parameters**

<i>forceServer</i>	
<i>authority</i>	

**Returns**

a URIType (p. 4063) instance containing the parsed data.

**Exceptions**

URISyntaxException	
--------------------	--

**6.853.3.8 URIType decaf::internal::net::URIHelper::parseURI ( const std::string & *uri*, bool *forceServer* ) throw ( decaf::net::URISyntaxException )**

Parse the passed in URI.

**Parameters**

<i>uri</i>	- the URI to Parse
<i>forceServer</i>	- if true invalid URI data throws an Exception

**Returns**

a URIType (p. 4063) instance containing the parsed data.

**Exceptions**

URISyntaxException	if <i>forceServer</i> is true and the URI is invalid.
--------------------	---

**6.853.3.9** void decaf::internal::net::URIHelper::validateAuthority ( const std::string & *uri*, const std::string & *authority*, std::size\_t *index* ) throw ( decaf::net::URISyntaxException )

Validate that the URI Authority Segment contains no invalid encodings.

#### Parameters

<i>uri</i>	- the full uri.
<i>authority</i>	- the Authority to check.
<i>index</i>	- position in the uri where Authority starts.

#### Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

**6.853.3.10** void decaf::internal::net::URIHelper::validateFragment ( const std::string & *uri*, const std::string & *fragment*, std::size\_t *index* ) throw ( decaf::net::URISyntaxException )

Validate that the URI fragment contains no invalid encodings.

#### Parameters

<i>uri</i>	- the full uri.
<i>fragment</i>	- the fragment to check.
<i>index</i>	- position in the uri where fragment starts.

#### Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

**6.853.3.11** void decaf::internal::net::URIHelper::validatePath ( const std::string & *uri*, const std::string & *path*, std::size\_t *index* ) throw ( decaf::net::URISyntaxException )

Validate that the URI Path Segment contains no invalid encodings.

#### Parameters

<i>uri</i>	- the full uri.
<i>path</i>	- the path to check.
<i>index</i>	- position in the uri where path starts.

#### Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

**6.853.3.12** void decaf::internal::net::URIHelper::validateQuery ( const std::string & *uri*, const std::string & *query*, std::size\_t *index* ) throw ( decaf::net::URISyntaxException )

Validate that the URI Query Segment contains no invalid encodings.

#### Parameters

<i>uri</i>	- the full uri.
<i>query</i>	- the query to check.
<i>index</i>	- position in the uri where fragment starts.

#### Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

**6.853.3.13** void decaf::internal::net::URIHelper::validateScheme ( const std::string & *uri*, const std::string & *scheme*, int *index* ) throw ( decaf::net::URISyntaxException )

Validate the schema portin of the URI.

#### Parameters

<i>uri</i>	- the URI to check.
<i>scheme</i>	- the schema section of the URI.
<i>index</i>	- index in uri where schema starts.

#### Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

**6.853.3.14** void decaf::internal::net::URIHelper::validateSsp ( const std::string & *uri*, const std::string & *ssp*, std::size\_t *index* ) throw ( decaf::net::URISyntaxException )

Validate that the URI Ssp Segment contains no invalid encodings.

#### Parameters

<i>uri</i>	- the full uri.
<i>ssp</i>	- the SSP to check.
<i>index</i>	- position in the uri where Ssp starts.

#### Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

**6.853.3.15** `void decaf::internal::net::URIHelper::validateUserinfo ( const std::string  
& uri, const std::string & userinfo, std::size_t index ) throw (   
decaf::net::URISyntaxException )`

Check the supplied user info for validity.

#### Parameters

<i>uri</i>	- the uri to parse.
<i>userinfo</i>	- supplied user info
<i>index</i>	- index into the URI string where the data is located.

#### Returns

true if valid

#### Exceptions

<i>URISyntaxException</i>	if an error occurs
---------------------------	--------------------

## 6.854 activemq::transport::failover::URIPool Class Reference

```
#include <src/main/activemq/transport/failover/URIPool.h>
```

### Public Member Functions

- **URIPool ()**  
*Create an Empty URI Pool.*
- **URIPool (const decaf::util::List< URI > &uris)**  
*Creates a new URI Pool using the given list as the initial Free List.*
- **~URIPool ()**
- **URI getURI () throw ( decaf::lang::exceptions::NoSuchElementException )**  
*Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.*
- **void addURI (const URI &uri)**  
*Adds a URI to the free list, callers that have previously taken one using the getURI method should always return the URI when they close the resource that was connected to that URI.*
- **void addURIs (const StlList< URI > &uris)**

*Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.*

- void **removeURI** (const **URI** &uri)

*Remove a given URI from the Free List.*

- bool **isRandomize** () const

*Is the URI that is given randomly picked from the pool or is each one taken in sequence.*

- void **setRandomize** (bool value)

*Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.*

### 6.854.1 Constructor & Destructor Documentation

#### 6.854.1.1 activemq::transport::failover::URIPool::URIPool ( )

Create an Empty URI Pool.

#### 6.854.1.2 activemq::transport::failover::URIPool::URIPool ( const decaf::util::List< **URI** > & *uris* )

Creates a new URI Pool using the given list as the initial Free List.

##### Parameters

<i>uris</i>	- List of URI to place in the Pool.
-------------	-------------------------------------

#### 6.854.1.3 activemq::transport::failover::URIPool::~~URIPool ( )

### 6.854.2 Member Function Documentation

#### 6.854.2.1 void activemq::transport::failover::URIPool::addURI ( const **URI** & *uri* )

Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

##### Parameters

<i>uri</i>	- a URI previously taken from the pool.
------------	---

**6.854.2.2** `void activemq::transport::failover::URIPool::addURIs ( const StlList< URI > & uris )`

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

#### Parameters

<i>uris</i>	- List of URIs to add into the Pool.
-------------	--------------------------------------

**6.854.2.3** `URI activemq::transport::failover::URIPool::getURI ( ) throw ( decaf::lang::exceptions::NoSuchElementException )`

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.

Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

#### Returns

the next free URI in the Pool.

#### Exceptions

<i>NoSuchElementException</i>	if there are none free currently.
-------------------------------	-----------------------------------

**6.854.2.4** `bool activemq::transport::failover::URIPool::isRandomize ( ) const [inline]`

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

#### Returns

true if URI gets are random.

**6.854.2.5** `void activemq::transport::failover::URIPool::removeURI ( const URI & uri )`

Remove a given URI from the Free List.

#### Parameters

<i>uri</i>	- the URI to find and remove from the free list
------------	---

**6.854.2.6** void **activemq::transport::failover::URIPool::setRandomize** ( bool *value* )  
[inline]

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

#### Parameters

<i>value</i>	- true indicates URI gets are random.
--------------	---------------------------------------

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/URIPool.h

## 6.855 activemq::util::URISupport Class Reference

```
#include <src/main/activemq/util/URISupport.h>
```

### Static Public Member Functions

- static void **parseURL** (const std::string &**URI**, **decaf::util::Properties** &properties) throw ( decaf::lang::exceptions::IllegalArgumentException )  
*Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.*
- static **CompositeData** **parseComposite** (const **URI** &uri) throw ( decaf::net::URISyntaxException )  
*Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.*
- static **decaf::util::Properties** **parseQuery** (std::string query) throw ( decaf::lang::exceptions::IllegalArgumentException )  
*Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.*
- static void **parseQuery** (std::string query, **decaf::util::Properties** \*properties) throw ( decaf::lang::exceptions::IllegalArgumentException )  
*Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.*
- static std::string **createQueryString** (const **Properties** &options) throw ( decaf::net::URISyntaxException )  
*Given a properties object create a string that can be appended to a URI as a valid Query string.*

### 6.855.1 Member Function Documentation

**6.855.1.1** `static std::string activemq::util::URISupport::createQueryString ( const Properties & options ) throw ( decaf::net::URISyntaxException ) [static]`

Given a properties object create a string that can be appended to a URI as a valid Query string.

#### Parameters

<i>options</i>	Properties object containing key / value query values.
----------------	--

#### Returns

a valid URI query string.

#### Exceptions

<i>URISyntaxException</i>	if the string in the Properties object can't be encoded into a valid URI Query string.
---------------------------	--

**6.855.1.2** `static CompositeData activemq::util::URISupport::parseComposite ( const URI & uri ) throw ( decaf::net::URISyntaxException ) [static]`

Parses a Composite URI into a Composite Data instance, the Composite URI takes the form: `scheme://(uri1,uri2,...uriN)?param1=value1`, each of the composite URIs is stored in the CompositeData's internal list.

#### Parameters

<i>uri</i>	- The Composite URI to parse.
------------	-------------------------------

#### Returns

a new **CompositeData** (p. 1253) object with the parsed data

#### Exceptions

<i>URISyntaxException</i>	if the URI is not well formed.
---------------------------	--------------------------------

**6.855.1.3** `static void activemq::util::URISupport::parseQuery ( std::string query, decaf::util::Properties * properties ) throw ( decaf::lang::exceptions::IllegalArgumentException ) [static]`

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

#### Parameters

<i>query</i>	- the query string to parse.
<i>properties</i>	- object pointer to get the parsed output.

### Exceptions

<i>IllegalArgumentException</i>	if the Query string is not well formed.
---------------------------------	---

**6.855.1.4** `static decaf::util::Properties activemq::util::URISupport::parseQuery ( std::string query ) throw ( decaf::lang::exceptions::IllegalArgumentException )`  
[static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

### Parameters

<i>query</i>	The query string to parse and extract the encoded properties.
--------------	---

### Returns

Properties object with the parsed output.

### Exceptions

<i>IllegalArgumentException</i>	if the Query string is not well formed.
---------------------------------	---

**6.855.1.5** `static void activemq::util::URISupport::parseURL ( const std::string & URI, decaf::util::Properties & properties ) throw ( decaf::lang::exceptions::IllegalArgumentException )` [static]

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

### Parameters

<i>URI</i>	a Broker URI to parse
<i>properties</i>	a Properties object to set the parsed values in

### Exceptions

<i>IllegalArgumentException</i>	if the passed URI is invalid
---------------------------------	------------------------------

The documentation for this class was generated from the following file:

### 6.856.1 Constructor & Destructor Documentation

**6.856.1.1** decaf::net::URISyntaxException::URISyntaxException ( ) throw () [inline]

Default Constructor.

**6.856.1.2** decaf::net::URISyntaxException::URISyntaxException ( const Exception & ex ) throw () [inline]

Conversion Constructor from some other Exception.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.856.1.3** decaf::net::URISyntaxException::URISyntaxException ( const URISyntaxException & ex ) throw () [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

**6.856.1.4** decaf::net::URISyntaxException::URISyntaxException ( const char \* file, const int lineNumber, const std::exception \* cause, const char \* msg, ... ) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.856.1.5** decaf::net::URISyntaxException::URISyntaxException ( const std::exception \* cause ) throw () [inline]

Constructor.

**Parameters**

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.856.1.6** `decaf::net::URISyntaxException::URISyntaxException ( const char * file, const int lineNumber, const char *msg DECAF_UNUSED ) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.  
Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.856.1.7** `decaf::net::URISyntaxException::URISyntaxException ( const char * file, const int lineNumber, const std::string & input, const std::string & reason ) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.  
Sets the input string that caused the error and the reason for the error.

**Parameters**

<i>file</i>	The file name where exception occurs.
<i>lineNumber</i>	The line number where the exception occurred.
<i>input</i>	The <b>URL</b> (p. 4072) that caused the exception.
<i>reason</i>	The reason for the failure.

**6.856.1.8** `decaf::net::URISyntaxException::URISyntaxException ( const char * file, const int lineNumber, const std::string & input, const std::string & reason, int index ) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.  
Sets the input string that caused the error and the reason for the error.

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>input</i>	The input <b>URI</b> (p. 4031) that caused the exception
<i>reason</i>	The reason for the failure.
<i>index</i>	The index in the <b>URI</b> (p. 4031) string where the error occurred.

6.856.1.9 `virtual decaf::net::URISyntaxException::~~URISyntaxException ( ) throw ()`  
`[inline, virtual]`

## 6.856.2 Member Function Documentation

6.856.2.1 `virtual URISyntaxException* decaf::net::URISyntaxException::clone ( ) const`  
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

### Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p. 1889).

6.856.2.2 `int decaf::net::URISyntaxException::getIndex ( ) const` `[inline]`

### Returns

the index in the input string where the error occurred or -1

6.856.2.3 `std::string decaf::net::URISyntaxException::getInput ( ) const` `[inline]`

### Returns

the Input string that cause this exception or ""

6.856.2.4 `std::string decaf::net::URISyntaxException::getReason ( ) const` `[inline]`

### Returns

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URISyntaxException.h`

## 6.857 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

```
#include <src/main/decaf/internal/net/URIType.h>
```

## Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () const  
*Gets the source URI string that was parsed to obtain this **URIType** (p. 4063) instance and the resulting data,.*
- void **setSource** (const std::string &source)  
*Sets the source URI string that was parsed to obtain this **URIType** (p. 4063) instance and the resulting data,.*
- std::string **getScheme** () const  
*Gets the Scheme of the URI, e.g.*
- void **setScheme** (const std::string &scheme)  
*Sets the Scheme of the URI, e.g.*
- std::string **getSchemeSpecificPart** () const  
*Gets the Scheme Specific Part of the URI.*
- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)  
*Sets the Scheme Specific Part of the URI.*
- std::string **getAuthority** () const  
*Gets the Authority of the URI.*

*Gets the Fragment part of the URI.*
- **void setFragment (const std::string &fragment)**  
*Sets the Fragment part of the URI.*
- **bool isOpaque () const**  
*Gets if the URI is Opaque.*
- **void setOpaque (bool opaque)**  
*Sets if the URI is Opaque.*
- **bool isAbsolute () const**  
*Gets if the URI is Absolute.*
- **void setAbsolute (bool absolute)**  
*Sets if the URI is Absolute.*
- **bool isServerAuthority () const**  
*Gets if the URI is a Server Authority.*
- **void setServerAuthority (bool serverAuthority)**  
*Sets if the URI is a Server Authority.*
- **bool isValid () const**  
*Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.*
- **void setValid (bool valid)**  
*Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.*

### 6.857.1 Detailed Description

Basic type object that holds data that composes a given URI.

### 6.857.2 Constructor & Destructor Documentation

**6.857.2.1** `decaf::internal::net::URIType::URIType ( const std::string & source )` `[inline]`

**6.857.2.2** `decaf::internal::net::URIType::URIType ( )` `[inline]`

**6.857.2.3** `virtual decaf::internal::net::URIType::~~URIType ( )` `[inline, virtual]`

### 6.857.3 Member Function Documentation

**6.857.3.1** `std::string decaf::internal::net::URIType::getAuthority ( ) const` `[inline]`

Gets the Authority of the URI.

#### Returns

Authority part string.

**6.857.3.2** `std::string decaf::internal::net::URIType::getFragment ( ) const` `[inline]`

Gets the Fragment part of the URI.

#### Returns

Fragment part string.

**6.857.3.3** `std::string decaf::internal::net::URIType::getHost ( ) const` `[inline]`

Gets the Host name part of the URI.

#### Returns

Host name part string.

**6.857.3.4** `std::string decaf::internal::net::URIType::getPath ( ) const` `[inline]`

Gets the Path part of the URI.

#### Returns

Path part string.

**6.857.3.5** `int decaf::internal::net::URIType::getPort ( ) const [inline]`

Gets the port part of the URI.

**Returns**

port part string, -1 if not set.

**6.857.3.6** `std::string decaf::internal::net::URIType::getQuery ( ) const [inline]`

Gets the Query part of the URI.

**Returns**

Query part string.

**6.857.3.7** `std::string decaf::internal::net::URIType::getScheme ( ) const [inline]`

Gets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

**Returns**

scheme part string.

**6.857.3.8** `std::string decaf::internal::net::URIType::getSchemeSpecificPart ( ) const [inline]`

Gets the Scheme Specific Part of the URI.

**Returns**

scheme specific part string.

**6.857.3.9** `std::string decaf::internal::net::URIType::getSource ( ) const [inline]`

Gets the source URI string that was parsed to obtain this **URIType** (p.4063) instance and the resulting data,.

**Returns**

the source URI string

**6.857.3.10** `std::string decaf::internal::net::URIType::getUserInfo ( ) const` `[inline]`

Gets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

**Returns**

user info part string.

**6.857.3.11** `bool decaf::internal::net::URIType::isAbsolute ( ) const` `[inline]`

Gets if the URI is Absolute.

**Returns**

true if Absolute.

**6.857.3.12** `bool decaf::internal::net::URIType::isOpaque ( ) const` `[inline]`

Gets if the URI is Opaque.

**Returns**

true if opaque.

**6.857.3.13** `bool decaf::internal::net::URIType::isServerAuthority ( ) const` `[inline]`

Gets if the URI is a Server Authority.

**Returns**

true if Server Authority.

**6.857.3.14** `bool decaf::internal::net::URIType::isValid ( ) const` `[inline]`

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

**Returns**

true if the **URIType** (p. 4063) contains valid data.

**6.857.3.15** `void decaf::internal::net::URIType::setAbsolute ( bool absolute )` `[inline]`

Sets if the URI is Absolute.

**Parameters**

<i>absolute</i>	- true if Absolute.
-----------------	---------------------

**6.857.3.16** void decaf::internal::net::URIType::setAuthority ( const std::string & *authority* )  
[inline]

Sets the Authority of the URI.

#### Parameters

<i>authority</i>	Authority part string.
------------------	------------------------

**6.857.3.17** void decaf::internal::net::URIType::setFragment ( const std::string & *fragment* )  
[inline]

Sets the Fragment part of the URI.

#### Parameters

<i>fragment</i>	- Fragment part string.
-----------------	-------------------------

**6.857.3.18** void decaf::internal::net::URIType::setHost ( const std::string & *host* )  
[inline]

Sets the Host name part of the URI.

#### Parameters

<i>host</i>	- Host name part string.
-------------	--------------------------

**6.857.3.19** void decaf::internal::net::URIType::setOpaque ( bool *opaque* ) [inline]

Sets if the URI is Opaque.

#### Parameters

<i>opaque</i>	true if opaque.
---------------	-----------------

**6.857.3.20** void decaf::internal::net::URIType::setPath ( const std::string & *path* )  
[inline]

Sets the Path part of the URI.

**Parameters**

<i>path</i>	- Path part string.
-------------	---------------------

**6.857.3.21** `void decaf::internal::net::URIType::setPort ( int port )` `[inline]`

Sets the port part of the URI.

**Parameters**

<i>port</i>	- port part string, -1 if not set.
-------------	------------------------------------

**6.857.3.22** `void decaf::internal::net::URIType::setQuery ( const std::string & query )`  
`[inline]`

Sets the Query part of the URI.

**Parameters**

<i>query</i>	- Query part string.
--------------	----------------------

**6.857.3.23** `void decaf::internal::net::URIType::setScheme ( const std::string & scheme )`  
`[inline]`

Sets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

**Parameters**

<i>scheme</i>	- scheme part string.
---------------	-----------------------

**6.857.3.24** `void decaf::internal::net::URIType::setSchemeSpecificPart ( const std::string & schemeSpecificPart )` `[inline]`

Sets the Scheme Specific Part of the URI.

**Parameters**

<i>scheme-SpecificPart</i>	- scheme specific part string.
----------------------------	--------------------------------

**6.857.3.25** void decaf::internal::net::URIType::setServerAuthority ( bool *serverAuthority* )  
[inline]

Sets if the URI is a Server Authority.

#### Parameters

<i>server-Authority</i>	- true if Server Authority.
-------------------------	-----------------------------

**6.857.3.26** void decaf::internal::net::URIType::setSource ( const std::string & *source* )  
[inline]

Sets the source URI string that was parsed to obtain this **URIType** (p. 4063) instance and the resulting data,.

#### Parameters

<i>source</i>	- the source URI string
---------------	-------------------------

**6.857.3.27** void decaf::internal::net::URIType::setUserInfo ( const std::string & *userinfo* )  
[inline]

Sets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

#### Parameters

<i>userinfo</i>	- user info part string.
-----------------	--------------------------

**6.857.3.28** void decaf::internal::net::URIType::setValid ( bool *valid* ) [inline]

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

#### Parameters

<i>valid</i>	- true if the <b>URIType</b> (p. 4063) contains valid data.
--------------	---

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIType.h`

## 6.858 decaf::net::URL Class Reference

Class **URL** (p. 4072) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

```
#include <src/main/decaf/net/URL.h>
```

### Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

#### 6.858.1 Detailed Description

Class **URL** (p. 4072) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web. A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

```
http://www.ksc.nasa.gov/facts/internet/url-primer.html
```

In general, a **URL** (p. 4072) can be broken into several parts. The previous example of a **URL** (p. 4072) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named `www.ksc.nasa.gov`. The information on that host machine is named `/facts/internet/url-primer.html`. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 4072) is called the path component.

A **URL** (p. 4072) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

```
http://www.ksc.nasa.gov:80/facts/internet/url-primer.html
```

The syntax of **URL** (p. 4072) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 4031)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports `scope_ids`. The syntax and usage of `scope_ids` is described here.

A **URL** (p. 4072) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

```
http://www.apache.org/cms/index.html#chapter1
```

This fragment is not technically part of the **URL** (p. 4072). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that

part of the document that has the tag `chapter1` attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 4072). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 4072):

```
http://www.apache.org/cms/index.html
```

contained within it the relative **URL** (p. 4072):

```
FAQ.html
```

it would be a shorthand for:

```
http://www.apache.org/cms/FAQ.html
```

The relative **URL** (p. 4072) need not specify all the components of a **URL** (p. 4072). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 4072). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 4072) class does not itself encode or decode any **URL** (p. 4072) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 4072), and also to decode any escaped fields, that are returned from **URL** (p. 4072). Furthermore, because **URL** (p. 4072) has no knowledge of **URL** (p. 4072) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 4072). For example, the two URLs:

```
http://foo.com/hello world/ and http://foo.com/hello%20world
```

would be considered not equal to each other.

Note, the **URI** (p. 4031) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 4031), and to convert between these two classes using `toURI()` and `URLtoURL()` (p. 4043).

The **URLEncoder** (p. 4074) and **URLDecoder** (p. 4074) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

## 6.858.2 Constructor & Destructor Documentation

**6.858.2.1** `decaf::net::URL::URL ( )`

**6.858.2.2** `decaf::net::URL::URL ( const std::string & url )`

**6.858.2.3** `virtual decaf::net::URL::~~URL ( ) [inline, virtual]`

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URL.h`

## 6.859 decaf::net::URLDecoder Class Reference

```
#include <src/main/decaf/net/URLDecoder.h>
```

### Public Member Functions

- virtual `~URLDecoder()`

### Static Public Member Functions

- static `std::string decode(const std::string &value)`

*Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.*

### 6.859.1 Constructor & Destructor Documentation

6.859.1.1 virtual `decaf::net::URLDecoder::~URLDecoder()` [`inline`, `virtual`]

### 6.859.2 Member Function Documentation

6.859.2.1 static `std::string decaf::net::URLDecoder::decode(const std::string &value)`  
[`static`]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.

'+' will be converted to space, '%' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C \$%"

#### Parameters

<i>value</i>	- string The encoded string.
--------------	------------------------------

#### Returns

The decoded version as a string.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLDecoder.h`

## 6.860 decaf::net::URLEncoder Class Reference

```
#include <src/main/decaf/net/URLEncoder.h>
```

## Public Member Functions

- virtual `~URLEncoder ()`

## Static Public Member Functions

- static `std::string encode (const std::string &value)`

*This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.*

### 6.860.1 Constructor & Destructor Documentation

6.860.1.1 `virtual decaf::net::URLEncoder::~URLEncoder ( ) [inline, virtual]`

### 6.860.2 Member Function Documentation

6.860.2.1 `static std::string decaf::net::URLEncoder::encode ( const std::string & value ) [static]`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '\*', '\_' are converted into their hexadecimal value prepended by ".

For example: '#' -> 23

In addition, spaces are substituted by '+'

#### Parameters

<i>value</i>	- the string to be converted
--------------	------------------------------

#### Returns

the converted string

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLEncoder.h`

## 6.861 activemq::util::Usage Class Reference

```
#include <src/main/activemq/util/Usage.h>
```

Inheritance diagram for `activemq::util::Usage`:

## Public Member Functions

- virtual `~Usage ()`
- virtual void `waitForSpace ()=0`  
*Waits forever for more space to be returned to this **Usage** (p. 4075) Manager.*
- virtual void `waitForSpace (unsigned int timeout)=0`  
*Waits for more space to be returned to this **Usage** (p. 4075) Manager, times out when the given time span in milliseconds elapses.*
- virtual void `enqueueUsage (unsigned long long value)=0`  
*Tries to increase the usage by value amount but blocks if this object is currently full.*
- virtual void `increaseUsage (unsigned long long value)=0`  
*Increases the usage by the value amount.*
- virtual void `decreaseUsage (unsigned long long value)=0`  
*Decreases the usage by the value amount.*
- virtual bool `isFull () const =0`  
*Returns true if this **Usage** (p. 4075) instance is full, i.e.*

## 6.861.1 Constructor & Destructor Documentation

6.861.1.1 virtual `activemq::util::Usage::~~Usage ( )` [`inline`, `virtual`]

## 6.861.2 Member Function Documentation

6.861.2.1 virtual void `activemq::util::Usage::decreaseUsage ( unsigned long long value )`  
`[pure virtual]`

Decreases the usage by the value amount.

### Parameters

<i>value</i>	Amount of space to return to the pool
--------------	---------------------------------------

Implemented in `activemq::util::MemoryUsage` (p. 2594).

6.861.2.2 virtual void `activemq::util::Usage::enqueueUsage ( unsigned long long value )`  
`[pure virtual]`

Tries to increase the usage by value amount but blocks if this object is currently full.

### Parameters

<i>value</i>	Amount of usage in bytes to add.
--------------	----------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2594).

**6.861.2.3** `virtual void activemq::util::Usage::increaseUsage ( unsigned long long value )`  
`[pure virtual]`

Increases the usage by the value amount.

#### Parameters

<i>value</i>	Amount of usage to add.
--------------	-------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2595).

**6.861.2.4** `virtual bool activemq::util::Usage::isFull ( ) const` `[pure virtual]`

Returns true if this **Usage** (p. 4075) instance is full, i.e.

**Usage** (p. 4075)  $\geq 100\%$

#### Returns

true if **Usage** (p. 4075) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 2595).

**6.861.2.5** `virtual void activemq::util::Usage::waitForSpace ( unsigned int timeout )` `[pure virtual]`

Waits for more space to be returned to this **Usage** (p. 4075) Manager, times out when the given time span in milliseconds elapses.

#### Parameters

<i>timeout</i>	The time to wait for more space.
----------------	----------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2596).

**6.861.2.6** `virtual void activemq::util::Usage::waitForSpace ( )` `[pure virtual]`

Waits forever for more space to be returned to this **Usage** (p. 4075) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 2595).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/Usage.h`

## 6.862 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

```
#include <src/main/decaf/io/UTFDataFormatException.h>
```

Inheritance diagram for decaf::io::UTFDataFormatException:

### Public Member Functions

- **UTFDataFormatException** () throw ()  
*Default Constructor.*
- **UTFDataFormatException** (const lang::Exception &ex) throw ()  
*Copy Constructor.*
- **UTFDataFormatException** (const UTFDataFormatException &ex) throw ()  
*Copy Constructor.*
- **UTFDataFormatException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **UTFDataFormatException** (const std::exception \*cause) throw ()  
*Constructor.*
- **UTFDataFormatException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor.*
- virtual **UTFDataFormatException** \* clone () const  
*Clones this exception.*
- virtual ~**UTFDataFormatException** () throw ()

### 6.862.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since

1.0

## 6.862.2 Constructor & Destructor Documentation

**6.862.2.1** decaf::io::UTFDataFormatException::UTFDataFormatException ( ) throw ()  
[inline]

Default Constructor.

**6.862.2.2** decaf::io::UTFDataFormatException::UTFDataFormatException ( const lang::Exception & ex ) throw () [inline]

Copy Constructor.

### Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

**6.862.2.3** decaf::io::UTFDataFormatException::UTFDataFormatException ( const UTFDataFormatException & ex ) throw () [inline]

Copy Constructor.

### Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

**6.862.2.4** decaf::io::UTFDataFormatException::UTFDataFormatException ( const char \* *file*, const int *lineNumber*, const std::exception \* *cause*, const char \* *msg*, ... ) throw ()  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.862.2.5** decaf::io::UTFDataFormatException::UTFDataFormatException ( const std::exception \* *cause* ) throw () [inline]

Constructor.

**Parameters**

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.862.2.6** `decaf::io::UTFDataFormatException::UTFDataFormatException ( const char * file,  
const int lineNumber, const char * msg, ... ) throw ()` `[inline]`

Constructor.

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

**6.862.2.7** `virtual decaf::io::UTFDataFormatException::~~UTFDataFormatException ( ) throw ()`  
`[inline, virtual]`

**6.862.3 Member Function Documentation**

**6.862.3.1** `virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone ( )const` `[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

**Returns**

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 2212).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/UTFDataFormatException.h`

**6.863 decaf::util::UUID Class Reference**

A class that represents an immutable universally unique identifier (**UUID** (p. 4080)).

```
#include <src/main/decaf/util/UUID.h>
```

Inheritance diagram for `decaf::util::UUID`:

## Public Member Functions

*Static factory to retrieve a type 3 (name based) **UUID** (p. 4080) based on the specified byte array.*
- static **UUID fromString** (const std::string &name) throw ( lang::exceptions::IllegalArgumentException )  
*Creates a **UUID** (p. 4080) from the string standard representation as described in the **toString**( ) (p. 4087) method.*

### 6.863.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 4080)). A **UUID** (p. 4080) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 4080) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 4080) is as follows: The most significant long consists of the following unsigned fields:

```
0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000
version 0x00000000000000FF time_hi
```

The least significant long consists of the following unsigned fields:

```
0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFF
node
```

The variant field contains a value which identifies the layout of the **UUID** (p. 4080). The bit layout described above is valid only for a **UUID** (p. 4080) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 4080). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

## 6.863.2 Constructor & Destructor Documentation

### 6.863.2.1 decaf::util::UUID::UUID ( long long *mostSigBits*, long long *leastSigBits* )

Constructs a new **UUID** (p. 4080) using the specified data.

*mostSigBits* is used for the most significant 64 bits of the **UUID** (p. 4080) and *leastSigBits* becomes the least significant 64 bits of the **UUID** (p. 4080).

#### Parameters

<i>mostSigBits</i>	
<i>leastSigBits</i>	

### 6.863.2.2 virtual decaf::util::UUID::~~UUID ( ) [virtual]

## 6.863.3 Member Function Documentation

### 6.863.3.1 virtual int decaf::util::UUID::clockSequence ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]

The clock sequence value associated with this **UUID** (p. 4080).

The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 4080). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 4080).

The *clockSequence* value is only meaningful in a time-based **UUID** (p. 4080), which has version type 1. If this **UUID** (p. 4080) is not a time-based **UUID** (p. 4080) then this method throws *UnsupportedOperationException*.

#### Returns

the *clockSequence* associated with a V1 **UUID** (p. 4080)

#### Exceptions

<i>UnsupportedOperationException</i>	
--------------------------------------	--

### 6.863.3.2 virtual int decaf::util::UUID::compareTo ( const UUID & *value* ) const [virtual]

Compare the given **UUID** (p. 4080) to this one.

#### Parameters

<i>value</i>	- the <b>UUID</b> (p. 4080) to compare to
--------------	---

**6.863.3.3** `virtual bool decaf::util::UUID::equals ( const UUID & value ) const` [virtual]

Compares this **UUID** (p. 4080) to the one given, returns true if they are equal.

#### Parameters

<i>value</i>	- the <b>UUID</b> (p. 4080) to compare to.
--------------	--

#### Returns

true if UUIDs are the same.

**6.863.3.4** `static UUID decaf::util::UUID::fromString ( const std::string & name ) throw ( lang::exceptions::IllegalArgumentException )` [static]

Creates a **UUID** (p. 4080) from the string standard representation as described in the `toString()` (p. 4087) method.

#### Parameters

<i>name</i>	- a string to be used to construct a <b>UUID</b> (p. 4080).
-------------	---

#### Returns

type 3 **UUID** (p. 4080)

**6.863.3.5** `virtual long long decaf::util::UUID::getLeastSignificantBits ( ) const` [virtual]

#### Returns

the most significant 64 bits of this UUID's 128 bit value.

**6.863.3.6** `virtual long long decaf::util::UUID::getMostSignificantBits ( ) const` [virtual]

#### Returns

the most significant 64 bits of this UUID's 128 bit value.

**6.863.3.7** `static UUID decaf::util::UUID::nameUUIDFromBytes ( const std::vector< char > & name )` [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 4080) based on the specified byte array.

#### Parameters

<i>name</i>	- a byte array to be used to construct a <b>UUID</b> (p. 4080).
-------------	---

**Returns**

type 3 **UUID** (p. 4080)

**6.863.3.8** static **UUID** decaf::util::UUID::nameUUIDFromBytes ( const char \* *name*, std::size\_t *size* ) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 4080) based on the specified byte array.

**Parameters**

<i>name</i>	- a byte array to be used to construct a <b>UUID</b> (p. 4080).
<i>size</i>	- the size of the byte array, or number of bytes to use.

**Returns**

type 3 **UUID** (p. 4080)

**6.863.3.9** virtual long long decaf::util::UUID::node ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]

The node value associated with this **UUID** (p. 4080).

The 48 bit node value is constructed from the node field of this **UUID** (p. 4080). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 4080) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 4080), which has version type 1. If this **UUID** (p. 4080) is not a time-based **UUID** (p. 4080) then this method throws UnsupportedOperationException.

**Returns**

the node value of this **UUID** (p. 4080)

**Exceptions**

<i>UnsupportedOperationException</i>	
--------------------------------------	--

**6.863.3.10** virtual bool decaf::util::UUID::operator< ( const **UUID** & *value* ) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

**Parameters**

<i>value</i>	- the value to be compared to this one.
--------------	---

**Returns**

true if this object is equal to the one passed.

**6.863.3.11** `virtual bool decaf::util::UUID::operator== ( const UUID & value ) const`  
[virtual]

Compares equality between this object and the one passed.

**Parameters**

<i>value</i>	- the value to be compared to this one.
--------------	---

**Returns**

true if this object is equal to the one passed.

**6.863.3.12** `static UUID decaf::util::UUID::randomUUID ( )` [static]

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 4080).

The **UUID** (p.4080) is generated using a cryptographically strong pseudo random number generator.

**Returns**

type 4 **UUID** (p. 4080)

**6.863.3.13** `virtual long long decaf::util::UUID::timestamp ( ) throw ( lang::exceptions::UnsupportedOperationException )` [virtual]

The timestamp value associated with this **UUID** (p. 4080).

The 60 bit timestamp value is constructed from the time\_low, time\_mid, and time\_hi fields of this **UUID** (p. 4080). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 4080), which has version type 1. If this **UUID** (p. 4080) is not a time-based **UUID** (p. 4080) then this method throws `UnsupportedOperationException`.

**Returns**

the timestamp associated with a V1 **UUID** (p. 4080)

**Exceptions**

<i>UnsupportedOperation Exception</i>	
---	--

**6.863.3.14** `virtual std::string decaf::util::UUID::toString ( ) const` [virtual]

Returns a String object representing this **UUID** (p. 4080).

UUID's are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

#### Returns

formatted string for this **UUID** (p. 4080)

**6.863.3.15** `virtual int decaf::util::UUID::variant ( ) throw ( lang::exceptions::UnsupportedOperationException )` [virtual]

The variant number associated with this **UUID** (p. 4080).

The variant number describes the layout of the **UUID** (p. 4080). The variant number has the following meaning:

\* 0 Reserved for NCS backward compatibility \* 2 The Leach-Salz variant (used by this class) \* 6 Reserved, Microsoft Corporation backward compatibility \* 7 Reserved for future definition

#### Returns

the variant associated with a V1 **UUID** (p. 4080)

#### Exceptions

<i>UnsupportedOperation Exception</i>	
---	--

**6.863.3.16** `virtual int decaf::util::UUID::version ( ) throw ( lang::exceptions::UnsupportedOperationException )` [virtual]

The version number associated with this **UUID** (p. 4080).

The version number describes how this **UUID** (p. 4080) was generated. The version number has the following meaning:

\* 1 Time-based **UUID** (p. 4080) \* 2 DCE security **UUID** (p. 4080) \* 3 Name-based **UUID** (p. 4080) \* 4 Randomly generated **UUID** (p. 4080)

#### Returns

the version associated with a V1 **UUID** (p. 4080)

**Exceptions**

<i>UnsupportedOperation Exception</i>
---

### 6.864.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

#### Version

#### Revision:

1.1

### 6.864.2 Constructor & Destructor Documentation

6.864.2.1 virtual activemq::wireformat::WireFormat::~WireFormat ( ) [inline, virtual]

### 6.864.3 Member Function Documentation

6.864.3.1 virtual **Pointer**<transport::Transport>  
activemq::wireformat::WireFormat::createNegotiator ( const  
**Pointer**< **transport::Transport** > & *transport* ) throw ( **decaf::lang::exceptions::UnsupportedOperationException** ) [pure  
virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

#### Parameters

<i>transport</i>	- the Transport to Wrap the Negotiator around.
------------------	--

#### Returns

new instance of a **WireFormatNegotiator** (p. 4129) as a **Pointer**<**Transport**> (p. 3032).

#### Exceptions

<i>UnsupportedOperationException</i>	if the <b>WireFormat</b> (p. 4088) doesn't have a Negotiator.
--------------------------------------	---

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2975), and **activemq::wireformat::stomp::StompWireFormat** (p. 3752).

**6.864.3.2** `virtual int activemq::wireformat::WireFormat::getVersion ( ) const [pure virtual]`

Get the Version.

#### Returns

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2977), and **activemq::wireformat::stomp::StompWireFormat** (p. 3752).

**6.864.3.3** `virtual bool activemq::wireformat::WireFormat::hasNegotiator ( ) const [pure virtual]`

Returns true if this **WireFormat** (p. 4088) has a Negotiator that needs to wrap the Transport that uses it.

#### Returns

true if the **WireFormat** (p. 4088) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2977), and **activemq::wireformat::stomp::StompWireFormat** (p. 3753).

**6.864.3.4** `virtual bool activemq::wireformat::WireFormat::inReceive ( ) const [pure virtual]`

Indicates if the WireFormat object is in the process of receiving a message.

This is useful for monitoring inactivity and the **WireFormat** (p. 4088) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 4088) instance to determine if its busy or not and not mark the connection as inactive if so.

#### Returns

true if the **WireFormat** (p. 4088) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2977), and **activemq::wireformat::stomp::StompWireFormat** (p. 3753).

**6.864.3.5** virtual void activemq::wireformat::WireFormat::marshal (   
const Pointer< commands::Command > & *command*,   
const activemq::transport::Transport \* *transport*,   
decaf::io::DataOutputStream \* *out* ) throw ( decaf::io::IOException )   
[pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

#### Parameters

<i>command</i>	The Command to Marshal
<i>transport</i>	The Transport that called this method.
<i>out</i>	The output stream to write the command to.

#### Exceptions

<i>IOException</i>	
--------------------	--

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2979), and **activemq::wireformat::stomp::StompWireFormat** (p. 3753).

**6.864.3.6** virtual void activemq::wireformat::WireFormat::setVersion ( int *version* ) [pure virtual]

Set the Version.

#### Parameters

<i>version</i>	the version of the wire format
----------------	--------------------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2982), and **activemq::wireformat::stomp::StompWireFormat** (p. 3753).

**6.864.3.7** virtual Pointer<commands::Command>   
activemq::wireformat::WireFormat::unmarshal ( const   
activemq::transport::Transport \* *transport*, decaf::io::DataInputStream   
\* *in* ) throw ( decaf::io::IOException ) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

#### Parameters

<i>transport</i>	- Pointer to the transport that is making this request.
<i>in</i>	- the input stream to read the command from.

**Returns**

the newly marshaled Command, caller owns the pointer

**Exceptions**

<i>IOException</i>
--------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2983), and **activemq::wireformat::stomp::StompWireFormat** (p. 3754).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormat.h**

**6.865 activemq::wireformat::WireFormatFactory Class Reference**

The **WireFormatFactory** (p. 4092) is the interface that all **WireFormatFactory** (p. 4092) classes must extend.

```
#include <src/main/activemq/wireformat/WireFormatFactory.h>
```

Inheritance diagram for activemq::wireformat::WireFormatFactory:

**Public Member Functions**

- virtual **~WireFormatFactory** ()
- virtual **Pointer< WireFormat > createWireFormat** (const **decaf::util::Properties** &properties)=0 throw ( **decaf::lang::exceptions::IllegalStateException** )

*Creates a new **WireFormat** (p. 4088) Object passing it a set of properties from which it can obtain any optional settings.*

**6.865.1 Detailed Description**

The **WireFormatFactory** (p. 4092) is the interface that all **WireFormatFactory** (p. 4092) classes must extend. The Factory creates a **WireFormat** (p. 4088) Object based on the properties that are set in the passed **Properties** object.

## 6.865.2 Constructor & Destructor Documentation

6.865.2.1 virtual activemq::wireformat::WireFormatFactory::~WireFormatFactory ( )  
[inline, virtual]

## 6.865.3 Member Function Documentation

6.865.3.1 virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat ( const decaf::util::Properties & *properties* ) throw ( decaf::lang::exceptions::IllegalStateException ) [pure virtual]

Creates a new **WireFormat** (p. 4088) Object passing it a set of properties from which it can obtain any optional settings.

### Parameters

<i>properties</i>	- the Properties for this <b>WireFormat</b> (p. 4088)
-------------------	---

### Returns

Pointer to a new instance of a **WireFormat** (p. 4088) object.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 2985), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 3755).

The documentation for this class was generated from the following file:

- virtual void **afterUnmarshal** (**wireformat::WireFormat** \*wireFormat **AMQCPP\_UNUSED**) throw ( **decaf::io::IOException** )  
*Called after unmarshaling is started to cleanup the object being unmarshaled.*

### Static Public Attributes

- static const unsigned char **ID\_WIREFORMATINFO** = 1

### 6.866.1 Constructor & Destructor Documentation

- 6.866.1.1 **activemq::commands::WireFormatInfo::WireFormatInfo** ( )
- 6.866.1.2 virtual **activemq::commands::WireFormatInfo::~~WireFormatInfo** ( ) [virtual]

### 6.866.2 Member Function Documentation

- 6.866.2.1 virtual void **activemq::commands::WireFormatInfo::afterUnmarshal** (**wireformat::WireFormat** \*wireFormat **AMQCPP\_UNUSED** ) throw ( **decaf::io::IOException** ) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

### Parameters

<i>wireFormat</i>	- the wireformat object to control unmarshaling
-------------------	---

Reimplemented from **activemq::commands::BaseDataStructure** (p. 839).

**6.866.2.2** `virtual void activemq::commands::WireFormatInfo::beforeMarshal ( wireformat::WireFormat *wireFormat AMQCPP_UNUSED ) throw ( decaf::io::IOException )` [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

#### Parameters

<i>wireFormat</i>	- the wire formatting controller
-------------------	----------------------------------

Reimplemented from **activemq::commands::BaseDataStructure** (p. 839).

**6.866.2.3** `virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure ( ) const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

#### Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1714).

**6.866.2.4** `virtual void activemq::commands::WireFormatInfo::copyDataStructure ( const DataStructure * src )` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

#### Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

**6.866.2.5** `virtual bool activemq::commands::WireFormatInfo::equals ( const DataStructure * value ) const` [virtual]

Compares the **DataStructure** (p. 1713) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

#### Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 766).

**6.866.2.6** `int activemq::commands::WireFormatInfo::getCacheSize ( ) const`

Gets the Cache Size setting.

#### Returns

currently set cache size.

**6.866.2.7** `virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

#### Returns

new **DataSetructure** (p. 1713) type copy.

Implements **activemq::commands::DataSetructure** (p. 1717).

**6.866.2.8** `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic ( ) const [inline]`

Get the Magic field.

#### Returns

const reference to a `std::vector<char>`

**6.866.2.9** `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshaledProperties ( ) const [inline]`

Get the marshalledProperties field.

#### Returns

const reference to a `std::vector<char>`

**6.866.2.10** `long long activemq::commands::WireFormatInfo::getMaxInactivityDuration ( ) const`

Returns the currently configured Max Inactivity duration.

#### Returns

the set inactivity duration value.

**6.866.2.11** `long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitialDelay ( ) const`

Returns the currently configured Max Inactivity Initial Delay duration.

**Returns**

the set inactivity duration initial delay value.

**6.866.2.12** `virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ( ) [inline, virtual]`

Gets the Properties for this **Command** (p. 1227).

**Returns**

the Properties object for this **Command** (p. 1227).

**6.866.2.13** `virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ( ) const [inline, virtual]`

Gets the Properties for this **Command** (p. 1227).

**Returns**

the Properties object for this **Command** (p. 1227).

**6.866.2.14** `int activemq::commands::WireFormatInfo::getVersion ( ) const [inline]`

Get the current Wireformat Version.

**Returns**

int that identifies the version

**6.866.2.15** `bool activemq::commands::WireFormatInfo::isCacheEnabled ( ) const`

Checks if the cacheEnabled flag is on.

**Returns**

true if the flag is on.

**6.866.2.16** `virtual bool activemq::commands::WireFormatInfo::isMarshalAware ( ) const`  
`[inline, virtual]`

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

#### Returns

boolean indicating desire to be in marshaling stages

Reimplemented from `activemq::commands::BaseDataStructure` (p. 840).

**6.866.2.17** `bool activemq::commands::WireFormatInfo::isSizePrefixDisabled ( ) const`

Checks if the `sizePrefixDisabled` flag is on.

#### Returns

true if the flag is on.

**6.866.2.18** `bool activemq::commands::WireFormatInfo::isStackTraceEnabled ( ) const`

Checks if the `stackTraceEnabled` flag is on.

#### Returns

true if the flag is on.

**6.866.2.19** `bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled ( ) const`

Checks if the `tcpNoDelayEnabled` flag is on.

#### Returns

true if the flag is on.

**6.866.2.20** `bool activemq::commands::WireFormatInfo::isTightEncodingEnabled ( ) const`

Checks if the `tightEncodingEnabled` flag is on.

#### Returns

true if the flag is on.

**6.866.2.21** `bool activemq::commands::WireFormatInfo::isValid ( ) const`

Determines if we think this is a Valid **WireFormatInfo** (p. 4093) command.

**Returns**

true if its valid.

**6.866.2.22** `virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo ( ) const`  
[inline, virtual]**Returns**

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.866.2.23** `void activemq::commands::WireFormatInfo::setCacheEnabled ( bool cacheEnabled )`

Sets if the cacheEnabled flag is on.

**Parameters**

<i>cacheEnabled</i>	- true to turn flag is on
---------------------	---------------------------

**6.866.2.24** `void activemq::commands::WireFormatInfo::setCacheSize ( int value )`

Sets the Cache Size setting.

**Parameters**

<i>value</i>	- value to set to the cache size.
--------------	-----------------------------------

**6.866.2.25** `void activemq::commands::WireFormatInfo::setMagic ( const std::vector< unsigned char > & magic )` [inline]

Sets the value of the magic field.

**Parameters**

<i>magic</i>	- const std::vector<char>
--------------	---------------------------

**6.866.2.26** `void activemq::commands::WireFormatInfo::setMarshaledProperties ( const  
std::vector< unsigned char > & marshalledProperties ) [inline]`

Sets the value of the `marshalledProperties` field.

#### Parameters

<i>marshalled- Properties</i>	The Byte Array vector that contains the marshaled form of the <b>Message</b> (p. 2596) properties, this is the data sent over the wire.
-----------------------------------	---

**6.866.2.27** `void activemq::commands::WireFormatInfo::setMaxInactivityDuration ( long long  
maxInactivityDuration )`

Sets the Max inactivity duration value.

#### Parameters

<i>maxInactivi- tyDuration</i>	- max time a client can be inactive.
------------------------------------	--------------------------------------

**6.866.2.28** `void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitalDelay ( long long  
maxInactivityDurationInitalDelay )`

Sets the Max inactivity initial delay duration value.

#### Parameters

<i>maxInactivi- tyDura- tionIni- talDelay</i>	- time before the inactivity delay is checked.
---	--

**6.866.2.29** `virtual void activemq::commands::WireFormatInfo::setProperties ( const  
util::PrimitiveMap & map ) [inline, virtual]`

Sets the Properties for this **Command** (p. 1227).

#### Parameters

<i>map</i>	- PrimitiveMap to copy
------------	------------------------

**6.866.2.30** `void activemq::commands::WireFormatInfo::setSizePrefixDisabled ( bool  
sizePrefixDisabled )`

Sets if the `sizePrefixDisabled` flag is on.

**Parameters**

<i>sizePre-fixDisabled</i>	- true to turn flag is on
----------------------------	---------------------------

**6.866.2.31** void activemq::commands::WireFormatInfo::setStackTraceEnabled ( bool *stackTraceEnabled* )

Sets if the stackTraceEnabled flag is on.

**Parameters**

<i>stack-TraceEnabled</i>	- ture to turn flag is on
---------------------------	---------------------------

**6.866.2.32** void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled ( bool *tcpNoDelayEnabled* )

Sets if the tcpNoDelayEnabled flag is on.

**Parameters**

<i>tcpNoDelayEnabled</i>	- ture to turn flag is on
--------------------------	---------------------------

**6.866.2.33** void activemq::commands::WireFormatInfo::setTightEncodingEnabled ( bool *tightEncodingEnabled* )

Sets if the tightEncodingEnabled flag is on.

**Parameters**

<i>tightEncodingEnabled</i>	- true to turn flag is on
-----------------------------	---------------------------

**6.866.2.34** void activemq::commands::WireFormatInfo::setVersion ( int *version* )  
[inline]

Set the current Wireformat Version.

**Parameters**

<i>version</i>	- int that identifies the version
----------------	-----------------------------------

**6.866.2.35** `virtual std::string activemq::commands::WireFormatInfo::toString ( ) const`  
`[virtual]`

Returns a string containing the information for this **DataStructure** (p. 1713) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 770).

**6.866.2.36** `virtual decaf::lang::Pointer<commands::Command>`  
`activemq::commands::WireFormatInfo::visit (`  
`activemq::state::CommandVisitor * visitor ) throw (`  
`exceptions::ActiveMQException ) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3379) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1232).

### 6.866.3 Field Documentation

**6.866.3.1** `const unsigned char activemq::commands::WireFormatInfo::ID_-`
