# Contents

This document is a short description of the COQ standard library. This library comes with the system as a complement of the core library (the **Init** library ; see the Reference Manual for a description of this library). It provides a set of modules directly available through the **Require** command.

The standard library is composed of the following subdirectories:

**Logic** Classical logic and dependent equality

**Bool** Booleans (basic functions and results)

**Arith** Basic Peano arithmetic

**ZArith** Basic integer arithmetic

**Reals** Classical Real Numbers and Analysis

**Lists** Monomorphic and polymorphic lists (basic functions and results), Streams (infinite sequences defined with co-inductive types)

**Sets** Sets (classical, constructive, finite, infinite, power set, etc.)

**Relations** Relations (definitions and basic results).

**Sorting** Sorted list (basic definitions and heapsort correctness).

**Wellfounded** Well-founded relations (basic results).

**Program** Tactics to deal with dependently-typed programs and their proofs.

**Classes** Standard type class instances on relations and Coq part of the setoid rewriting tactic.

Each of these subdirectories contains a set of modules, whose specifications (GALLINA files) have been roughly, and automatically, pasted in the following pages. There is also a version of this document in HTML format on the WWW, which you can access from the COQ home page at <http://coq.inria.fr/library>.

# Chapter 1

## Library **Coq.Init.Datatypes**

**Set Implicit Arguments.**

**Require Import** Notations.

**Require Import** Logic.

### 1.1 Datatypes with zero and one element

*Empty\_set* is a datatype with no inhabitant

**Inductive** *Empty\_set* : **Set** :=.

*unit* is a singleton datatype with sole inhabitant *tt*

**Inductive** *unit* : **Set** :=

*tt* : *unit*.

### 1.2 The boolean datatype

*bool* is the datatype of the boolean values *true* and *false*

**Inductive** *bool* : **Set** :=

| *true* : *bool*

| *false* : *bool*.

**Add Printing** *If bool*.

**Delimit Scope** *bool\_scope* **with** *bool*.

Basic boolean operators

**Definition** *andb* (*b1 b2*:*bool*) : *bool* := *if b1 then b2 else false*.

**Definition** *orb* (*b1 b2*:*bool*) : *bool* := *if b1 then true else b2*.

**Definition** *implb* (*b1 b2*:*bool*) : *bool* := *if b1 then b2 else true*.

**Definition** *xorb* (*b1 b2*:*bool*) : *bool* :=

*match b1, b2 with*

| *true, true* => *false*

```

| true, false ⇒ true
| false, true ⇒ true
| false, false ⇒ false
end.
Definition negb (b:bool) := if b then false else true.
Infix "||" := orb : bool_scope.
Infix "&&" := andb : bool_scope.

Basic properties of andb
Lemma andb_prop : ∀ a b:bool, andb a b = true → a = true ∧ b = true.
Hint Resolve andb_prop: bool.
Lemma andb_true_intro :
  ∀ b1 b2:bool, b1 = true ∧ b2 = true → andb b1 b2 = true.
Hint Resolve andb_true_intro: bool.

Interpretation of booleans as propositions
Inductive eq_true : bool → Prop := is_eq_true : eq_true true.
Hint Constructors eq_true : eq_true.

Another way of interpreting booleans as propositions
Definition is_true b := b = true.

is_true can be activated as a coercion by (Local) Coercion is_true : bool >-> Sortclass.
Additional rewriting lemmas about eq_true
Lemma eq_true_ind_r :
  ∀ (P : bool → Prop) (b : bool), P b → eq_true b → P true.
Lemma eq_true_rec_r :
  ∀ (P : bool → Set) (b : bool), P b → eq_true b → P true.
Lemma eq_true_rect_r :
  ∀ (P : bool → Type) (b : bool), P b → eq_true b → P true.

The BoolSpec inductive will be used to relate a boolean value and two propositions corresponding
respectively to the true case and the false case. Interest: BoolSpec behave nicely with case and
destruct. See also Bool.reflect when Q = ¬P.
Inductive BoolSpec (P Q : Prop) : bool → Prop :=
| BoolSpecT : P → BoolSpec P Q true
| BoolSpecF : Q → BoolSpec P Q false.
Hint Constructors BoolSpec.

```

### 1.3 Peano natural numbers

*nat* is the datatype of natural numbers built from *O* and successor *S*; note that the constructor name is the letter O. Numbers in *nat* can be denoted using a decimal notation; e.g. `3%nat` abbreviates *S (S (S O))*

```
Inductive nat : Set :=
```

```

| O : nat
| S : nat → nat.

```

Delimit Scope *nat\_scope* with *nat*.

## 1.4 Container datatypes

*option A* is the extension of *A* with an extra element *None*

```

Inductive option (A:Type) : Type :=
| Some : A → option A
| None : option A.

```

```

Definition option_map (A B:Type) (f:A→B) (o : option A) : option B :=
match o with
| Some a ⇒ @Some B (f a)
| None ⇒ @None B
end.

```

*sum A B*, written  $A + B$ , is the disjoint sum of *A* and *B*

```

Inductive sum (A B:Type) : Type :=
| inl : A → sum A B
| inr : B → sum A B.

```

Notation " $x + y$ " := (*sum x y*) : *type\_scope*.

*prod A B*, written  $A \times B$ , is the product of *A* and *B*; the pair *pair A B a b* of *a* and *b* is abbreviated (*a, b*)

```

Inductive prod (A B:Type) : Type :=
pair : A → B → prod A B.

```

Add Printing Let *prod*.

Notation " $x * y$ " := (*prod x y*) : *type\_scope*.

Notation "( x , y , .. , z )" := (*pair .. (pair x y) .. z*) : *core\_scope*.

Section projections.

```

Context {A : Type} {B : Type}.

```

```

Definition fst (p:A × B) := match p with
| (x, y) ⇒ x
end.

```

```

Definition snd (p:A × B) := match p with
| (x, y) ⇒ y
end.

```

End projections.

Hint Resolve *pair inl inr*: *core*.

Lemma surjective\_pairing :

```

∀ (A B:Type) (p:A × B), p = pair (fst p) (snd p).

```

Lemma injective\_projections :

$\forall (A B:\text{Type}) (p1\ p2:A \times B),$   
 $\text{fst } p1 = \text{fst } p2 \rightarrow \text{snd } p1 = \text{snd } p2 \rightarrow p1 = p2.$

Definition prod\_uncurry (A B C:Type) (f:prod A B → C)  
(x:A) (y:B) : C := f (pair x y).

Definition prod\_curry (A B C:Type) (f:A → B → C)  
(p:prod A B) : C := match p with  
| pair x y ⇒ f x y  
end.

Polymorphic lists and some operations

Inductive list (A : Type) : Type :=  
| nil : list A  
| cons : A → list A → list A.

Infix "::" := cons (at level 60, right associativity) : list\_scope.

Delimit Scope list\_scope with list.

Local Open Scope list\_scope.

Definition length (A : Type) : list A → nat :=  
fix length l :=  
match l with  
| nil ⇒ 0  
| \_ :: l' ⇒ S (length l')  
end.

Concatenation of two lists

Definition app (A : Type) : list A → list A → list A :=  
fix app l m :=  
match l with  
| nil ⇒ m  
| a :: l1 ⇒ a :: app l1 m  
end.

Infix "++" := app (right associativity, at level 60) : list\_scope.

## 1.5 The comparison datatype

Inductive comparison : Set :=  
| Eq : comparison  
| Lt : comparison  
| Gt : comparison.

Definition CompOpp (r:comparison) :=  
match r with  
| Eq ⇒ Eq  
| Lt ⇒ Gt

| Gt  $\Rightarrow$  Lt  
end.

**Lemma** *CompOpp\_involutive* :  $\forall c, \text{CompOpp } (\text{CompOpp } c) = c$ .

**Lemma** *CompOpp\_inj* :  $\forall c c', \text{CompOpp } c = \text{CompOpp } c' \rightarrow c = c'$ .

**Lemma** *CompOpp\_iff* :  $\forall c c', \text{CompOpp } c = c' \leftrightarrow c = \text{CompOpp } c'$ .

The *CompareSpec* inductive relates a *comparison* value with three propositions, one for each possible case. Typically, it can be used to specify a comparison function via some equality and order predicates. Interest: *CompareSpec* behave nicely with **case** and **destruct**.

**Inductive** *CompareSpec* (*Peq Plt Pgt* : **Prop**) : **comparison**  $\rightarrow$  **Prop** :=  
| *CompEq* : *Peq*  $\rightarrow$  *CompareSpec* *Peq Plt Pgt* *Eq*  
| *CompLt* : *Plt*  $\rightarrow$  *CompareSpec* *Peq Plt Pgt* *Lt*  
| *CompGt* : *Pgt*  $\rightarrow$  *CompareSpec* *Peq Plt Pgt* *Gt*.

**Hint Constructors** *CompareSpec*.

For having clean interfaces after extraction, *CompareSpec* is declared in **Prop**. For some situations, it is nonetheless useful to have a version in **Type**. Interestingly, these two versions are equivalent.

**Inductive** *CompareSpecT* (*Peq Plt Pgt* : **Prop**) : **comparison**  $\rightarrow$  **Type** :=  
| *CompEqT* : *Peq*  $\rightarrow$  *CompareSpecT* *Peq Plt Pgt* *Eq*  
| *CompLtT* : *Plt*  $\rightarrow$  *CompareSpecT* *Peq Plt Pgt* *Lt*  
| *CompGtT* : *Pgt*  $\rightarrow$  *CompareSpecT* *Peq Plt Pgt* *Gt*.

**Hint Constructors** *CompareSpecT*.

**Lemma** *CompareSpec2Type* :  $\forall \text{Peq Plt Pgt } c,$   
*CompareSpec* *Peq Plt Pgt* *c*  $\rightarrow$  *CompareSpecT* *Peq Plt Pgt* *c*.

As an alternate formulation, one may also directly refer to predicates *eq* and *lt* for specifying a comparison, rather than fully-applied propositions. This *CompSpec* is now a particular case of *CompareSpec*.

**Definition** *CompSpec* {*A*} (*eq lt* : *A*  $\rightarrow$  *A*  $\rightarrow$  **Prop**) (*x y* : *A*) : **comparison**  $\rightarrow$  **Prop** :=  
*CompareSpec* (*eq* *x y*) (*lt* *x y*) (*lt* *y x*).

**Definition** *CompSpecT* {*A*} (*eq lt* : *A*  $\rightarrow$  *A*  $\rightarrow$  **Prop**) (*x y* : *A*) : **comparison**  $\rightarrow$  **Type** :=  
*CompareSpecT* (*eq* *x y*) (*lt* *x y*) (*lt* *y x*).

**Hint Unfold** *CompSpec* *CompSpecT*.

**Lemma** *CompSpec2Type* :  $\forall A (eq lt : A \rightarrow A \rightarrow \text{Prop}) x y c,$   
*CompSpec* *eq lt* *x y* *c*  $\rightarrow$  *CompSpecT* *eq lt* *x y* *c*.

## 1.6 Misc Other Datatypes

*identity* *A a* is the family of datatypes on *A* whose sole non-empty member is the singleton datatype *identity* *A a a* whose sole inhabitant is denoted *refl\_identity* *A a*

**Inductive** *identity* (*A* : **Type**) (*a* : *A*) : *A*  $\rightarrow$  **Type** :=  
*identity\_refl* : *identity* *a a*.

**Hint Resolve** *identity\_refl*: *core*.

Identity type

**Definition** ID :=  $\forall A:\mathbf{Type}, A \rightarrow A$ .

**Definition** id : ID := fun A x  $\Rightarrow$  x.

**Definition** IDProp :=  $\forall A:\mathbf{Prop}, A \rightarrow A$ .

**Definition** idProp : IDProp := fun A x  $\Rightarrow$  x.

## Chapter 2

# Library Coq.Init.Logic\_Type

This module defines type constructors for types in **Type** (*Datatypes.v* and *Logic.v* defined them for types in **Set**)

**Set** **Implicit Arguments**.

**Require Import** **Datatypes**.

**Require Export** **Logic**.

Negation of a type in **Type**

**Definition** **notT** (*A*:**Type**) := *A* → **False**.

Properties of *identity*

**Section** **identity\_is\_a\_congruence**.

**Variables** *A B* : **Type**.

**Variable** *f* : *A* → *B*.

**Variables** *x y z* : *A*.

**Lemma** **identity\_sym** : **identity** *x y* → **identity** *y x*.

**Lemma** **identity\_trans** : **identity** *x y* → **identity** *y z* → **identity** *x z*.

**Lemma** **identity\_congr** : **identity** *x y* → **identity** (*f x*) (*f y*).

**Lemma** **not\_identity\_sym** : **notT** (**identity** *x y*) → **notT** (**identity** *y x*).

**End** **identity\_is\_a\_congruence**.

**Definition** **identity\_ind\_r** :

$\forall (A:\mathbf{Type}) (a:A) (P:A \rightarrow \mathbf{Prop}), P\ a \rightarrow \forall y:A, \mathbf{identity}\ y\ a \rightarrow P\ y.$

**Defined**.

**Definition** **identity\_rec\_r** :

$\forall (A:\mathbf{Type}) (a:A) (P:A \rightarrow \mathbf{Set}), P\ a \rightarrow \forall y:A, \mathbf{identity}\ y\ a \rightarrow P\ y.$

**Defined**.

**Definition** **identity\_rect\_r** :

$\forall (A:\mathbf{Type}) (a:A) (P:A \rightarrow \mathbf{Type}), P\ a \rightarrow \forall y:A, \mathbf{identity}\ y\ a \rightarrow P\ y.$

**Defined**.

**Hint Immediate** *identity\_sym not\_identity\_sym*: *core v62*.

```
Notation refl_id := identity_refl (compat "8.3").
Notation sym_id := identity_sym (compat "8.3").
Notation trans_id := identity_trans (compat "8.3").
Notation sym_not_id := not_identity_sym (compat "8.3").
```

## Chapter 3

# Library Coq.Init.Logic

Set Implicit Arguments.

Require Export Notations.

Notation "A -> B" := ( $\forall$  ( $_$  : A), B) : type\_scope.

### 3.1 Propositional connectives

*True* is the always true proposition

Inductive True : Prop :=

| : True.

*False* is the always false proposition Inductive False : Prop :=.

*not* A, written  $\neg A$ , is the negation of A Definition not (A:Prop) := A  $\rightarrow$  False.

Notation "~ x" := (not x) : type\_scope.

Hint Unfold not: core.

*and* A B, written  $A \wedge B$ , is the conjunction of A and B

*conj* p q is a proof of  $A \wedge B$  as soon as p is a proof of A and q a proof of B

*proj1* and *proj2* are first and second projections of a conjunction

Inductive and (A B:Prop) : Prop :=

conj : A  $\rightarrow$  B  $\rightarrow$  A  $\wedge$  B

where "A /\ B" := (and A B) : type\_scope.

Section Conjunction.

Variables A B : Prop.

Theorem proj1 : A  $\wedge$  B  $\rightarrow$  A.

Theorem proj2 : A  $\wedge$  B  $\rightarrow$  B.

End Conjunction.

*or* A B, written  $A \vee B$ , is the disjunction of A and B

Inductive or (A B:Prop) : Prop :=

| or\_introl :  $A \rightarrow A \vee B$   
| or\_intror :  $B \rightarrow A \vee B$

where "A  $\vee$  B" := (or A B) : type\_scope.

iff A B, written  $A \leftrightarrow B$ , expresses the equivalence of A and B

Definition iff (A B:Prop) := (A  $\rightarrow$  B)  $\wedge$  (B  $\rightarrow$  A).

Notation "A  $\leftrightarrow$  B" := (iff A B) : type\_scope.

Section Equivalence.

Theorem iff\_refl :  $\forall A:\text{Prop}, A \leftrightarrow A$ .

Theorem iff\_trans :  $\forall A B C:\text{Prop}, (A \leftrightarrow B) \rightarrow (B \leftrightarrow C) \rightarrow (A \leftrightarrow C)$ .

Theorem iff\_sym :  $\forall A B:\text{Prop}, (A \leftrightarrow B) \rightarrow (B \leftrightarrow A)$ .

End Equivalence.

Hint Unfold iff: extcore.

Backward direction of the equivalences above does not need assumptions

Theorem and\_iff\_compat\_l :  $\forall A B C : \text{Prop},$   
 $(B \leftrightarrow C) \rightarrow (A \wedge B \leftrightarrow A \wedge C)$ .

Theorem and\_iff\_compat\_r :  $\forall A B C : \text{Prop},$   
 $(B \leftrightarrow C) \rightarrow (B \wedge A \leftrightarrow C \wedge A)$ .

Theorem or\_iff\_compat\_l :  $\forall A B C : \text{Prop},$   
 $(B \leftrightarrow C) \rightarrow (A \vee B \leftrightarrow A \vee C)$ .

Theorem or\_iff\_compat\_r :  $\forall A B C : \text{Prop},$   
 $(B \leftrightarrow C) \rightarrow (B \vee A \leftrightarrow C \vee A)$ .

Some equivalences

Theorem neg\_false :  $\forall A : \text{Prop}, \neg A \leftrightarrow (A \leftrightarrow \text{False})$ .

Theorem and\_cancel\_l :  $\forall A B C : \text{Prop},$   
 $(B \rightarrow A) \rightarrow (C \rightarrow A) \rightarrow ((A \wedge B \leftrightarrow A \wedge C) \leftrightarrow (B \leftrightarrow C))$ .

Theorem and\_cancel\_r :  $\forall A B C : \text{Prop},$   
 $(B \rightarrow A) \rightarrow (C \rightarrow A) \rightarrow ((B \wedge A \leftrightarrow C \wedge A) \leftrightarrow (B \leftrightarrow C))$ .

Theorem and\_comm :  $\forall A B : \text{Prop}, A \wedge B \leftrightarrow B \wedge A$ .

Theorem and\_assoc :  $\forall A B C : \text{Prop}, (A \wedge B) \wedge C \leftrightarrow A \wedge B \wedge C$ .

Theorem or\_cancel\_l :  $\forall A B C : \text{Prop},$   
 $(B \rightarrow \neg A) \rightarrow (C \rightarrow \neg A) \rightarrow ((A \vee B \leftrightarrow A \vee C) \leftrightarrow (B \leftrightarrow C))$ .

Theorem or\_cancel\_r :  $\forall A B C : \text{Prop},$   
 $(B \rightarrow \neg A) \rightarrow (C \rightarrow \neg A) \rightarrow ((B \vee A \leftrightarrow C \vee A) \leftrightarrow (B \leftrightarrow C))$ .

Theorem or\_comm :  $\forall A B : \text{Prop}, (A \vee B) \leftrightarrow (B \vee A)$ .

Theorem or\_assoc :  $\forall A B C : \text{Prop}, (A \vee B) \vee C \leftrightarrow A \vee B \vee C$ .

Lemma iff\_and :  $\forall A B : \text{Prop}, (A \leftrightarrow B) \rightarrow (A \rightarrow B) \wedge (B \rightarrow A)$ .

Lemma iff\_to\_and :  $\forall A B : \text{Prop}, (A \leftrightarrow B) \leftrightarrow (A \rightarrow B) \wedge (B \rightarrow A)$ .

$(IF\_then\_else\ P\ Q\ R)$ , written  $IF\ P\ then\ Q\ else\ R$  denotes either  $P$  and  $Q$ , or  $\neg P$  and  $Q$

**Definition**  $IF\_then\_else\ (P\ Q\ R:Prop) := P \wedge Q \vee \neg P \wedge R$ .

**Notation** "'IF' c1 'then' c2 'else' c3" :=  $(IF\_then\_else\ c1\ c2\ c3)$   
(at level 200, right associativity) : *type\_scope*.

## 3.2 First-order quantifiers

$ex\ P$ , or simply  $\exists x, P\ x$ , or also  $\exists x:A, P\ x$ , expresses the existence of an  $x$  of some type  $A$  in **Set** which satisfies the predicate  $P$ . This is existential quantification.

$ex2\ P\ Q$ , or simply  $exists2\ x, P\ x \ \&\ Q\ x$ , or also  $exists2\ x:A, P\ x \ \&\ Q\ x$ , expresses the existence of an  $x$  of type  $A$  which satisfies both predicates  $P$  and  $Q$ .

Universal quantification is primitively written  $\forall x:A, Q$ . By symmetry with existential quantification, the construction  $all\ P$  is provided too.

**Inductive**  $ex\ (A:Type)\ (P:A \rightarrow Prop) : Prop :=$   
 $ex\_intro : \forall x:A, P\ x \rightarrow ex\ (A:=A)\ P$ .

**Inductive**  $ex2\ (A:Type)\ (P\ Q:A \rightarrow Prop) : Prop :=$   
 $ex\_intro2 : \forall x:A, P\ x \rightarrow Q\ x \rightarrow ex2\ (A:=A)\ P\ Q$ .

**Definition**  $all\ (A:Type)\ (P:A \rightarrow Prop) := \forall x:A, P\ x$ .

**Notation** "'exists' x .. y , p" :=  $(ex\ (fun\ x \Rightarrow ..\ (ex\ (fun\ y \Rightarrow p))\ ..))$   
(at level 200,  $x$  binder, right associativity,  
*format* "'[' 'exists' '/' 'x .. y , '/' 'p ']'")  
: *type\_scope*.

**Notation** "'exists2' x , p & q" :=  $(ex2\ (fun\ x \Rightarrow p)\ (fun\ x \Rightarrow q))$   
(at level 200,  $x$  ident,  $p$  at level 200, right associativity) : *type\_scope*.

**Notation** "'exists2' x : t , p & q" :=  $(ex2\ (fun\ x:t \Rightarrow p)\ (fun\ x:t \Rightarrow q))$   
(at level 200,  $x$  ident,  $t$  at level 200,  $p$  at level 200, right associativity,  
*format* "'[' 'exists2' '/' 'x : t , '/' '[' p & '/' q ']' ']'")  
: *type\_scope*.

Derived rules for universal quantification

**Section** *universal\_quantification*.

**Variable**  $A : Type$ .

**Variable**  $P : A \rightarrow Prop$ .

**Theorem**  $inst : \forall x:A, all\ (fun\ x \Rightarrow P\ x) \rightarrow P\ x$ .

**Theorem**  $gen : \forall (B:Prop) (f:\forall y:A, B \rightarrow P\ y), B \rightarrow all\ P$ .

**End** *universal\_quantification*.

## 3.3 Equality

$eq\ x\ y$ , or simply  $x=y$  expresses the equality of  $x$  and  $y$ . Both  $x$  and  $y$  must belong to the same type  $A$ . The definition is inductive and states the reflexivity of the equality. The others properties

(symmetry, transitivity, replacement of equals by equals) are proved below. The type of  $x$  and  $y$  can be made explicit using the notation  $x = y :> A$ . This is Leibniz equality as it expresses that  $x$  and  $y$  are equal iff every property on  $A$  which is true of  $x$  is also true of  $y$

```
Inductive eq (A:Type) (x:A) : A → Prop :=
  eq_refl : x = x :> A
```

```
where "x = y :> A" := (@eq A x y) : type_scope.
```

```

  (x2 y2:A2) (x3 y3:A3),
  x1 = y1 → x2 = y2 → x3 = y3 → f x1 x2 x3 = f y1 y2 y3.

Theorem f_equal4 :
  ∀ (A1 A2 A3 A4 B:Type) (f:A1 → A2 → A3 → A4 → B)
  (x1 y1:A1) (x2 y2:A2) (x3 y3:A3) (x4 y4:A4),
  x1 = y1 → x2 = y2 → x3 = y3 → x4 = y4 → f x1 x2 x3 x4 = f y1 y2 y3 y4.

Theorem f_equal5 :
  ∀ (A1 A2 A3 A4 A5 B:Type) (f:A1 → A2 → A3 → A4 → A5 → B)
  (x1 y1:A1) (x2 y2:A2) (x3 y3:A3) (x4 y4:A4) (x5 y5:A5),
  x1 = y1 →
  x2 = y2 →
  x3 = y3 → x4 = y4 → x5 = y5 → f x1 x2 x3 x4 x5 = f y1 y2 y3 y4 y5.

Theorem f_equal_compose : ∀ A B C (a b:A) (f:A→B) (g:B→C) (e:a=b),
  f_equal g (f_equal f e) = f_equal (fun a => g (f a)) e.

The goupoid structure of equality

Theorem eq_trans_refl_l : ∀ A (x y:A) (e:x=y), eq_trans eq_refl e = e.
Theorem eq_trans_refl_r : ∀ A (x y:A) (e:x=y), eq_trans e eq_refl = e.
Theorem eq_sym_involutive : ∀ A (x y:A) (e:x=y), eq_sym (eq_sym e) = e.
Theorem eq_trans_sym_inv_l : ∀ A (x y:A) (e:x=y), eq_trans (eq_sym e) e = eq_refl.
Theorem eq_trans_sym_inv_r : ∀ A (x y:A) (e:x=y), eq_trans e (eq_sym e) = eq_refl.
Theorem eq_trans_assoc : ∀ A (x y z t:A) (e:x=y) (e':y=z) (e'':z=t),

```

$\text{eq\_trans } e \text{ (eq\_trans } e' \text{ } e'') = \text{eq\_trans (eq\_trans } e \text{ } e') \text{ } e''.$

Extra properties of equality

**Theorem** `eq_id_comm_l` :  $\forall A (f:A \rightarrow A) (Hf:\forall a, a = f a), \forall a, \text{f\_equal } f (Hf a) = Hf (f a).$

**Theorem** `eq_id_comm_r` :  $\forall A (f:A \rightarrow A) (Hf:\forall a, f a = a), \forall a, \text{f\_equal } f (Hf a) = Hf (f a).$

**Lemma** `eq_trans_map_distr` :  $\forall A B x y z (f:A \rightarrow B) (e:x=y) (e':y=z), \text{f\_equal } f (\text{eq\_trans } e \text{ } e') = \text{eq\_trans (f\_equal } f \text{ } e) (\text{f\_equal } f \text{ } e').$

**Lemma** `eq_sym_map_distr` :  $\forall A B (x y:A) (f:A \rightarrow B) (e:x=y), \text{eq\_sym (f\_equal } f \text{ } e) = \text{f\_equal } f (\text{eq\_sym } e).$

**Lemma** `eq_trans_sym_distr` :  $\forall A (x y z:A) (e:x=y) (e':y=z), \text{eq\_sym (eq\_trans } e \text{ } e') = \text{eq\_trans (eq\_sym } e') (\text{eq\_sym } e).$

**Notation** `sym_eq` := `eq_sym (compat "8.3")`.

**Notation** `trans_eq` := `eq_trans (compat "8.3")`.

**Notation** `sym_not_eq` := `not_eq_sym (compat "8.3")`.

**Notation** `refl_equal` := `eq_refl (compat "8.3")`.

**Notation** `sym_equal` := `eq_sym (compat "8.3")`.

**Notation** `trans_equal` := `eq_trans (compat "8.3")`.

**Notation** `sym_not_equal` := `not_eq_sym (compat "8.3")`.

**Hint Immediate** `eq_sym not_eq_sym`: *core*.

Basic definitions about relations and properties

**Definition** `subrelation` ( $A B : \text{Type}$ ) ( $R R' : A \rightarrow B \rightarrow \text{Prop}$ ) :=  
 $\forall x y, R x y \rightarrow R' x y.$

**Definition** `unique` ( $A : \text{Type}$ ) ( $P : A \rightarrow \text{Prop}$ ) ( $x:A$ ) :=  
 $P x \wedge \forall (x':A), P x' \rightarrow x=x'.$

**Definition** `uniqueness` ( $A:\text{Type}$ ) ( $P:A \rightarrow \text{Prop}$ ) :=  $\forall x y, P x \rightarrow P y \rightarrow x = y.$

Unique existence

**Notation** "'exists' ! x .. y , p" :=  
 $(\text{ex (unique (fun } x \Rightarrow \dots (\text{ex (unique (fun } y \Rightarrow p)))) \dots))$   
 $(\text{at level 200, } x \text{ binder, right associativity,}$   
 $\text{format "[ 'exists' ! ' / ' x .. y , ' / ' p ]'")$   
 $: \text{type\_scope}.$

**Lemma** `unique_existence` :  $\forall (A:\text{Type}) (P:A \rightarrow \text{Prop}),$   
 $((\exists x, P x) \wedge \text{uniqueness } P) \leftrightarrow (\exists! x, P x).$

**Lemma** `forall_exists_unique_domain_coincide` :  
 $\forall A (P:A \rightarrow \text{Prop}), (\exists! x, P x) \rightarrow$   
 $\forall Q:A \rightarrow \text{Prop}, (\forall x, P x \rightarrow Q x) \leftrightarrow (\exists x, P x \wedge Q x).$

**Lemma** `forall_exists_coincide_unique_domain` :  
 $\forall A (P:A \rightarrow \text{Prop}),$   
 $(\forall Q:A \rightarrow \text{Prop}, (\forall x, P x \rightarrow Q x) \leftrightarrow (\exists x, P x \wedge Q x))$   
 $\rightarrow (\exists! x, P x).$

### 3.4 Being inhabited

The predicate *inhabited* can be used in different contexts. If  $A$  is thought as a type, *inhabited*  $A$  states that  $A$  is inhabited. If  $A$  is thought as a computationally relevant proposition, then *inhabited*  $A$  weakens  $A$  so as to hide its computational meaning. The so-weakened proof remains computationally relevant but only in a propositional context.

Inductive *inhabited* ( $A$ :Type) : Prop := inhabits :  $A \rightarrow$  *inhabited*  $A$ .

Hint Resolve *inhabits*: core.

Lemma exists\_inhabited :  $\forall (A:\text{Type}) (P:A \rightarrow \text{Prop}),$   
 $(\exists x, P\ x) \rightarrow$  *inhabited*  $A$ .

Declaration of *stepl* and *stepr* for *eq* and *iff*

Lemma eq\_stepl :  $\forall (A : \text{Type}) (x\ y\ z : A), x = y \rightarrow x = z \rightarrow z = y$ .

Declare Left Step eq\_stepl.

Declare Right Step eq\_trans.

Lemma iff\_stepl :  $\forall A\ B\ C : \text{Prop}, (A \leftrightarrow B) \rightarrow (A \leftrightarrow C) \rightarrow (C \leftrightarrow B)$ .

Declare Left Step iff\_stepl.

Declare Right Step iff\_trans.

## Chapter 4

# Library **Coq.Init.Notations**

These are the notations whose level and associativity are imposed by Coq

Notations for propositional connectives

**Reserved Notation** " $x \rightarrow y$ " (at level 99, right associativity,  $y$  at level 200).

**Reserved Notation** " $x \leftrightarrow y$ " (at level 95, no associativity).

**Reserved Notation** " $x \wedge y$ " (at level 80, right associativity).

**Reserved Notation** " $x \vee y$ " (at level 85, right associativity).

**Reserved Notation** " $\sim x$ " (at level 75, right associativity).

Notations for equality and inequalities

**Reserved Notation** " $x = y :> T$ "

(at level 70,  $y$  at *next level*, no associativity).

**Reserved Notation** " $x = y$ " (at level 70, no associativity).

**Reserved Notation** " $x = y = z$ "

(at level 70, no associativity,  $y$  at *next level*).

**Reserved Notation** " $x <> y :> T$ "

(at level 70,  $y$  at *next level*, no associativity).

**Reserved Notation** " $x <> y$ " (at level 70, no associativity).

**Reserved Notation** " $x \leq y$ " (at level 70, no associativity).

**Reserved Notation** " $x < y$ " (at level 70, no associativity).

**Reserved Notation** " $x \geq y$ " (at level 70, no associativity).

**Reserved Notation** " $x > y$ " (at level 70, no associativity).

**Reserved Notation** " $x \leq y \leq z$ " (at level 70,  $y$  at *next level*).

**Reserved Notation** " $x \leq y < z$ " (at level 70,  $y$  at *next level*).

**Reserved Notation** " $x < y < z$ " (at level 70,  $y$  at *next level*).

**Reserved Notation** " $x < y \leq z$ " (at level 70,  $y$  at *next level*).

Arithmetical notations (also used for type constructors)

**Reserved Notation** " $x + y$ " (at level 50, left associativity).

**Reserved Notation** " $x - y$ " (at level 50, left associativity).

**Reserved Notation** " $x * y$ " (at level 40, left associativity).

**Reserved Notation** " $x / y$ " (at level 40, left associativity).

**Reserved Notation** " $- x$ " (at level 35, right associativity).

Reserved Notation  $/ x$  (at level 35, right associativity).

Reserved Notation  $x \wedge y$  (at level 30, right associativity).

Notations for booleans

Reserved Notation  $x \parallel y$  (at level 50, left associativity).

Reserved Notation  $x \&\& y$  (at level 40, left associativity).

Notations for pairs

Reserved Notation  $(x, y, \dots, z)$  (at level 0).

Notation  $\{x\}$  is reserved and has a special status as component of other notations such as  $\{A\} + \{B\}$  and  $A + \{B\}$  (which are at the same level as  $x + y$ );  $\{x\}$  is at level 0 to factor with  $\{x : A \mid P\}$

Reserved Notation  $\{x\}$  (at level 0,  $x$  at level 99).

Notations for sigma-types or subsets

Reserved Notation  $\{x \mid P\}$  (at level 0,  $x$  at level 99).

Reserved Notation  $\{x \mid P \& Q\}$  (at level 0,  $x$  at level 99).

Reserved Notation  $\{x : A \mid P\}$  (at level 0,  $x$  at level 99).

Reserved Notation  $\{x : A \mid P \& Q\}$  (at level 0,  $x$  at level 99).

Reserved Notation  $\{x : A \& P\}$  (at level 0,  $x$  at level 99).

Reserved Notation  $\{x : A \& P \& Q\}$  (at level 0,  $x$  at level 99).

ML Tactic Notations

## Chapter 5

# Library `Coq.Init.Peano`

The type *nat* of Peano natural numbers (built from *O* and *S*) is defined in *Datatypes.v*. This module defines the following operations on natural numbers :

- predecessor *pred*
- addition *plus*
- multiplication *mult*
- less or equal order *le*
- less *lt*
- greater or equal *ge*
- greater *gt*

It states various lemmas and theorems about natural numbers, including Peano's axioms of arithmetic (in Coq, these are provable). Case analysis on *nat* and induction on  $\text{nat} \times \text{nat}$  are provided too

```
Require Import Notations.
Require Import Datatypes.
Require Import Logic.
Require Coq.Init.Nat.

Open Scope nat_scope.

Definition eq_S := f_equal S.
Definition f_equal_nat := f_equal (A:=nat).

Hint Resolve eq_S: v62.
Hint Resolve f_equal_nat: core.
```

The predecessor function

```
Notation pred := Nat.pred (compat "8.4").
Definition f_equal_pred := f_equal pred.
```

Hint Resolve *f\_equal\_pred*: *v62*.

Theorem *pred\_Sn* :  $\forall n:\text{nat}, n = \text{pred } (\text{S } n)$ .

Injectivity of successor

Definition *eq\_add\_S*  $n\ m\ (H:\text{S } n = \text{S } m): n = m := \text{f\_equal pred } H$ .

Hint Immediate *eq\_add\_S*: *core*.

Theorem *not\_eq\_S* :  $\forall n\ m:\text{nat}, n \neq m \rightarrow \text{S } n \neq \text{S } m$ .

Hint Resolve *not\_eq\_S*: *core*.

Definition *IsSucc*  $(n:\text{nat}) : \text{Prop} :=$

```
match n with
| 0 => False
| S p => True
end.
```

Zero is not the successor of a number

Theorem *O\_S* :  $\forall n:\text{nat}, 0 \neq \text{S } n$ .

Hint Resolve *O\_S*: *core*.

Theorem *n\_Sn* :  $\forall n:\text{nat}, n \neq \text{S } n$ .

Hint Resolve *n\_Sn*: *core*.

Addition

Notation *plus* := *Nat.add* (*compat* "8.4").

Infix "+" := *Nat.add* : *nat\_scope*.

Definition *f\_equal2\_plus* := *f\_equal2 plus*.

Hint Resolve *f\_equal2\_plus*: *v62*.

Definition *f\_equal2\_nat* := *f\_equal2* (*A1*:=*nat*) (*A2*:=*nat*).

Hint Resolve *f\_equal2\_nat*: *core*.

Lemma *plus\_n\_O* :  $\forall n:\text{nat}, n = n + 0$ .

Hint Resolve *plus\_n\_O*: *core*.

Lemma *plus\_O\_n* :  $\forall n:\text{nat}, 0 + n = n$ .

Add Printing Let  $\text{sig}2$ .  
Add Printing Let  $\text{sig}T$ .  
Add Printing Let  $\text{sig}T2$ .

## Projections of *sig*

An element  $y$  of a subset  $\{x:A \mid (P\ x)\}$  is the pair of an  $a$  of type  $A$  and of a proof  $h$  that  $a$  satisfies  $P$ . Then  $(proj1\_sig\ y)$  is the witness  $a$  and  $(proj2\_sig\ y)$  is the proof of  $(P\ a)$

## Section Subset\_projections.

Variable  $A$  : Type.

Variable  $P : A \rightarrow \text{Prop}$ .

```

Definition proj1_sig (e:sig P) := match e with
| exist _ a b => a
end.

```

```

Definition proj2_sig (e:sig P) :=
  match e return P (proj1_sig e) with
  | exist _ a b => b
  end.

```

End Subset\_projections.

*sig2* of a predicate can be projected to a *sig*.

This allows *proj1-sig* and *proj2-sig* to be usable with *sig2*.

The **let** statements occur in the body of the *exist* so that *proj1\_sig* of a coerced  $X : sig2\ P\ Q$  will unify with **let**  $(a, -, -) := X$  in  $a$

```

Definition sig_of_sig2 (A : Type) (P Q : A → Prop) (X : sig2 P Q) : sig P
:= exist P
    (let (a, -, -) := X in a)
    (let (x, p, -) as s return (P (let (a, -, -) := s in a)) := X in p).

```

## Projections of *sig2*

An element  $y$  of a subset  $\{x:A \mid (P\ x) \ \& \ (Q\ x)\}$  is the triple of an  $a$  of type  $A$ , a of a proof  $h$  that  $a$  satisfies  $P$ , and a proof  $h'$  that  $a$  satisfies  $Q$ . Then  $(proj1\text{-}sig\ (sig\text{-}of\text{-}sig2\ y))$  is the witness  $a$ ,  $(proj2\text{-}sig\ (sig\text{-}of\text{-}sig2\ y))$  is the proof of  $(P\ a)$ , and  $(proj3\text{-}sig\ y)$  is the proof of  $(Q\ a)$ .

## Section Subset\_projections2.

Variable  $A$  : Type.

Variables  $P \ Q : A \rightarrow \text{Prop}$ .

```

Definition proj3_sig (e : sig2 P Q) :=
  let (a, b, c) return Q (proj1_sig (sig_of_sig2 e)) := e in c.

```

End Subset\_projections2.

## Projections of *sigT*

An element  $x$  of a sigma-type  $\{y:A \ \& \ P \ y\}$  is a dependent pair made of an  $a$  of type  $A$  and an  $h$  of type  $P \ a$ . Then,  $(projT1 \ x)$  is the first projection and  $(projT2 \ x)$  is the second projection, the type of which depends on the  $projT1$ .

### Section Projections.

Variable  $A$  : Type.

Variable  $P : A \rightarrow \text{Type}$ .

Definition  $\text{projT1 } (x:\text{sigT } P) : A := \text{match } x \text{ with}$   
 $\quad | \text{existT } _ \ a \ _ \Rightarrow a$   
 $\text{end.}$

Definition  $\text{projT2 } (x:\text{sigT } P) : P (\text{projT1 } x) :=$   
 $\quad \text{match } x \text{ return } P (\text{projT1 } x) \text{ with}$   
 $\quad | \text{existT } _ \ _ \ h \Rightarrow h$   
 $\text{end.}$

End Projections.

$\text{sigT2}$  of a predicate can be projected to a  $\text{sigT}$ .

This allows  $\text{projT1}$  and  $\text{projT2}$  to be usable with  $\text{sigT2}$ .

The **let** statements occur in the body of the  $\text{existT}$  so that  $\text{projT1}$  of a coerced  $X : \text{sigT2 } P \ Q$  will unify with **let**  $(a, -, -) := X$  in  $a$

Definition  $\text{sigT\_of\_sigT2 } (A : \text{Type}) (P \ Q : A \rightarrow \text{Type}) (X : \text{sigT2 } P \ Q) : \text{sigT } P$   
 $:= \text{existT } P$   
 $\quad (\text{let } (a, -, -) := X \text{ in } a)$   
 $\quad (\text{let } (x, p, -) \text{ as } s \text{ return } (P (\text{let } (a, -, -) := s \text{ in } a)) := X \text{ in } p).$

Projections of  $\text{sigT2}$

An element  $x$  of a sigma-type  $\{y:A \ \& \ P \ y \ \& \ Q \ y\}$  is a dependent pair made of an  $a$  of type  $A$ , an  $h$  of type  $P \ a$ , and an  $h'$  of type  $Q \ a$ . Then,  $(\text{projT1 } (\text{sigT\_of\_sigT2 } x))$  is the first projection,  $(\text{projT2 } (\text{sigT\_of\_sigT2 } x))$  is the second projection, and  $(\text{projT3 } x)$  is the third projection, the types of which depends on the  $\text{projT1}$ .

Section Projections2.

Variable  $A : \text{Type}$ .

Variables  $P \ Q : A \rightarrow \text{Type}$ .

Definition  $\text{projT3 } (e : \text{sigT2 } P \ Q) :=$   
 $\quad \text{let } (a, b, c) \text{ return } Q (\text{projT1 } (\text{sigT\_of\_sigT2 } e)) := e \text{ in } c.$

End Projections2.

$\text{sigT}$  of a predicate is equivalent to  $\text{sig}$

Definition  $\text{sig\_of\_sigT } (A : \text{Type}) (P : A \rightarrow \text{Prop}) (X : \text{sigT } P) : \text{sig } P$   
 $:= \text{exist } P (\text{projT1 } X) (\text{projT2 } X).$

Definition  $\text{sigT\_of\_sig } (A : \text{Type}) (P : A \rightarrow \text{Prop}) (X : \text{sig } P) : \text{sigT } P$   
 $:= \text{existT } P (\text{proj1\_sig } X) (\text{proj2\_sig } X).$

$\text{sigT2}$  of a predicate is equivalent to  $\text{sig2}$

Definition  $\text{sig2\_of\_sigT2 } (A : \text{Type}) (P \ Q : A \rightarrow \text{Prop}) (X : \text{sigT2 } P \ Q) : \text{sig2 } P \ Q$   
 $:= \text{exist2 } P \ Q (\text{projT1 } (\text{sigT\_of\_sigT2 } X)) (\text{projT2 } (\text{sigT\_of\_sigT2 } X)) (\text{projT3 } X).$

Definition  $\text{sigT2\_of\_sig2 } (A : \text{Type}) (P \ Q : A \rightarrow \text{Prop}) (X : \text{sig2 } P \ Q) : \text{sigT2 } P \ Q$   
 $:= \text{existT2 } P \ Q (\text{proj1\_sig } (\text{sig\_of\_sig2 } X)) (\text{proj2\_sig } (\text{sig\_of\_sig2 } X)) (\text{proj3\_sig } X).$

$\text{sumbool}$  is a boolean type equipped with the justification of their value

Inductive  $\text{sumbool } (A \ B:\text{Prop}) : \text{Set} :=$

```

| left : A → {A} + {B}
| right : B → {A} + {B}
where "{ A } + { B }" := (sumbool A B) : type_scope.

## Chapter 8

# Library `Coq.Init.Tactics`

```
Require Import Notations.  
Require Import Logic.  
Require Import Specif.
```

### 8.1 Useful tactics

Ex falso quodlibet : a tactic for proving `False` instead of the current goal. This is just a nicer name for tactics such as `elimtype False` and other `cut False`.

```
Ltac exfalso := elimtype False.
```

A tactic for proof by contradiction. With contradict `H`,

- $H: \neg A \vdash B$  gives  $\vdash A$
- $H: \neg A \vdash \neg B$  gives  $H: B \vdash A$
- $H: A \vdash B$  gives  $\vdash \neg A$
- $H: A \vdash \neg B$  gives  $H: B \vdash \neg A$
- $H: \text{False}$  leads to a resolved subgoal.

Moreover, negations may be in unfolded forms, and `A` or `B` may live in `Type`

```
Ltac contradict H :=  
  let save tac H := let x := fresh in intro x; tac H; rename x into H  
  in  
  let negpos H := case H; clear H  
  in  
  let negneg H := save negpos H  
  in  
  let pospos H :=  
    let A := type of H in (exfalso; revert H; try fold ( $\neg A$ ))  
  in  
  let posneg H := save pospos H
```

```

in
let neg H := match goal with
| ⊢ (¬_) ⇒ negneg H
| ⊢ (_→False) ⇒ negneg H
| ⊢ _ ⇒ negpos H
end in
let pos H := match goal with
| ⊢ (¬_) ⇒ posneg H
| ⊢ (_→False) ⇒ posneg H
| ⊢ _ ⇒ pospos H
end in
match type of H with
| (¬_) ⇒ neg H
| (_→False) ⇒ neg H
| _ ⇒ (elim H;fail) || pos H
end.

Ltac swap H :=
  idtac "swap is OBSOLETE: use contradict instead.";
  intro; apply H; clear H.

Ltac absurd_hyp H :=
  idtac "absurd_hyp is OBSOLETE: use contradict instead.";
  let T := type of H in
  absurd T.

Ltac false_hyp H G :=
  let T := type of H in absurd T; [ apply G | assumption ].

Ltac case_eq x := generalize (eq_refl x); pattern x at -1; case x.

Ltac destr_eq H := discriminate H || (try (injection H; clear H; intro H)).

Tactic Notation "destruct_with_eqn" constr(x) :=
  destruct x eqn:?.
Tactic Notation "destruct_with_eqn" ident(n) :=
  try intros until n; destruct n eqn:?.
Tactic Notation "destruct_with_eqn" ":" ident(H) constr(x) :=
  destruct x eqn:H.
Tactic Notation "destruct_with_eqn" ":" ident(H) ident(n) :=
  try intros until n; destruct n eqn:H.

  Break every hypothesis of a certain type

Ltac destruct_all t :=
  match goal with
  | x : t ⊢ _ ⇒ destruct x; destruct_all t
  | _ ⇒ idtac
  end.

```

**Tactic Notation** "rewrite\_all" **constr**(*eq*) := repeat rewrite *eq* in \*.

**Tactic Notation** "rewrite\_all" "<-" **constr**(*eq*) := repeat rewrite  $\leftarrow$  *eq* in \*.

Tactics for applying equivalences.

The following code provides tactics “apply  $\rightarrow$  t”, “apply  $\leftarrow$  t”, “apply  $\rightarrow$  t in H” and “apply  $\leftarrow$  t in H”. Here t is a term whose type consists of nested dependent and nondependent products with an equivalence  $A \leftrightarrow B$  as the conclusion. The tactics with “ $\rightarrow$ ” in their names apply  $A \rightarrow B$  while those with “ $\leftarrow$ ” in the name apply  $B \rightarrow A$ .

```
Ltac find_equiv H :=
let T := type of H in
lazymatch T with
| ?A  $\rightarrow$  ?B  $\Rightarrow$ 
  let H1 := fresh in
  let H2 := fresh in
  cut A;
  [intro H1; pose proof (H H1) as H2; clear H H1;
   rename H2 into H; find_equiv H |
   clear H]
|  $\forall$  x : ?t, _  $\Rightarrow$ 
  let a := fresh "a" with
    H1 := fresh "H" in
    evar (a : t); pose proof (H a) as H1; unfold a in H1;
    clear a; clear H; rename H1 into H; find_equiv H
| ?A  $\leftrightarrow$  ?B  $\Rightarrow$  idtac
| _  $\Rightarrow$  fail "The given statement does not seem to end with an equivalence."
end.
```

```
Ltac bapply lemma todo :=
let H := fresh in
  pose proof lemma as H;
  find_equiv H; [todo H; clear H | .. ].
```

**Tactic Notation** "apply" " $\rightarrow$ " **constr**(*lemma*) :=  
*bapply lemma ltac*:(fun H  $\Rightarrow$  destruct H as [H \_]; apply H).

**Tactic Notation** "apply" " $\leftarrow$ " **constr**(*lemma*) :=  
*bapply lemma ltac*:(fun H  $\Rightarrow$  destruct H as [\_ H]; apply H).

**Tactic Notation** "apply" " $\rightarrow$ " **constr**(*lemma*) "in" *hyp*(*J*) :=  
*bapply lemma ltac*:(fun H  $\Rightarrow$  destruct H as [H \_]; apply H in J).

**Tactic Notation** "apply" " $\leftarrow$ " **constr**(*lemma*) "in" *hyp*(*J*) :=  
*bapply lemma ltac*:(fun H  $\Rightarrow$  destruct H as [\_ H]; apply H in J).

An experimental tactic simpler than auto that is useful for ending proofs “in one step”

```
Ltac easy :=
let rec use_hyp H :=
  match type of H with
  | _  $\wedge$  _  $\Rightarrow$  exact H || destruct_hyp H
  | _  $\Rightarrow$  try solve [inversion H]
```

```

    end
with do_intro := let H := fresh in intro H; use_hyp H
with destruct_hyp H := case H; clear H; do_intro; do_intro in
let rec use_hyps :=
  match goal with
  | H : _ ∧ _ ⊢ _ ⇒ exact H || (destruct_hyp H; use_hyps)
  | H : _ ⊢ _ ⇒ solve [inversion H]
  | _ ⇒ idtac
  end in
let do_atom :=
  solve [ trivial with eq_true | reflexivity | symmetry; trivial | contradiction ] in
let rec do_ccl :=
  try do_atom;
  repeat (do_intro; try do_atom);
  solve [ split; do_ccl ] in
solve [ do_atom | use_hyps; do_ccl ] ||
fail "Cannot solve this goal".

Tactic Notation "now" tactic(t) := t; easy.

  Slightly more than easy

Ltac easy' := repeat split; simpl; easy || now destruct 1.

  A tactic to document or check what is proved at some point of a script

Ltac now_show c := change c.

  Support for rewriting decidability statements

Set Implicit Arguments.

Lemma decide_left : ∀ (C:Prop) (decide:{C}+{¬C}),
  C → ∀ P:{C}+{¬C}→Prop, (∀ H:C, P (left _ H)) → P decide.

Lemma decide_right : ∀ (C:Prop) (decide:{C}+{¬C}),
  ¬C → ∀ P:{C}+{¬C}→Prop, (∀ H:¬C, P (right _ H)) → P decide.

Tactic Notation "decide" constr(lemma) "with" constr(H) :=
  let try_to_merge_hyps H :=
    try (clear H; intro H) ||
    (let H' := fresh H "bis" in intro H'; try clear H') ||
    (let H' := fresh in intro H'; try clear H') in
  match type of H with
  | ¬ ?C ⇒ apply (decide_right lemma H); try_to_merge_hyps H
  | ?C → False ⇒ apply (decide_right lemma H); try_to_merge_hyps H
  | _ ⇒ apply (decide_left lemma H); try_to_merge_hyps H
  end.

  Clear an hypothesis and its dependencies

Tactic Notation "clear" "dependent" hyp(h) :=
  let rec depclear h :=
    clear h ||

```

```

match goal with
|  $H$  : context [  $h$  ]  $\vdash$  _  $\Rightarrow$  depclear  $H$ ; depclear  $h$ 
end ||
fail "hypothesis to clear is used in the conclusion (maybe indirectly)"
in depclear  $h$ .

```

Revert an hypothesis and its dependencies : this is actually generalize dependent...

```

Tactic Notation "revert" "dependent" hyp( $h$ ) :=
generalize dependent  $h$ .

```

## Library **Coq.Init.Nat**

**Require Import** Notations Logic Datatypes.

**Local Open Scope** *nat\_scope*.

### 10.1 Peano natural numbers, definitions of operations

This file is meant to be used as a whole module, without importing it, leading to qualified definitions (e.g. `Nat.pred`)

**Definition** `t` := `nat`.

#### 10.1.1 Constants

**Definition** `zero` := 0.

**Definition** `one` := 1.

**Definition** `two` := 2.

#### 10.1.2 Basic operations

**Definition** `succ` := `S`.

**Definition** `pred` `n` :=  
  `match` `n` `with`  
    | 0  $\Rightarrow$  `n`  
    | `S` `u`  $\Rightarrow$  `u`  
  `end`.

**Fixpoint** `add` `n` `m` :=  
  `match` `n` `with`  
    | 0  $\Rightarrow$  `m`  
    | `S` `p`  $\Rightarrow$  `S` (`p` + `m`)  
  `end`

**where** "`n` + `m`" := (`add` `n` `m`) : *nat\_scope*.

Definition double  $n := n + n$ .

Fixpoint mul  $n\ m :=$   
 match  $n$  with  
 | 0  $\Rightarrow$  0  
 | S  $p \Rightarrow m + p \times m$   
 end

where "n \* m" := (mul  $n\ m$ ) : *nat\_scope*.

Truncated subtraction:  $n - m$  is 0 if  $n \leq m$

Fixpoint sub  $n\ m :=$   
 match  $n, m$  with  
 | S  $k, S\ l \Rightarrow k - l$   
 |  $-, - \Rightarrow n$   
 end

where "n - m" := (sub  $n\ m$ ) : *nat\_scope*.

### 10.1.3 Comparisons

Fixpoint eqb  $n\ m : \text{bool} :=$   
 match  $n, m$  with  
 | 0, 0  $\Rightarrow$  true  
 | 0, S  $- \Rightarrow$  false  
 | S  $-, 0 \Rightarrow$  false  
 | S  $n', S\ m' \Rightarrow$  eqb  $n'\ m'$   
 end.

Fixpoint leb  $n\ m : \text{bool} :=$   
 match  $n, m$  with  
 | 0,  $- \Rightarrow$  true  
 |  $-, 0 \Rightarrow$  false  
 | S  $n', S\ m' \Rightarrow$  leb  $n'\ m'$   
 end.

Definition ltb  $n\ m :=$  leb (S  $n$ )  $m$ .

Infix "==" := eqb (at level 70) : *nat\_scope*.

Infix "<=" := leb (at level 70) : *nat\_scope*.

Infix "<" := ltb (at level 70) : *nat\_scope*.

Fixpoint compare  $n\ m : \text{comparison} :=$   
 match  $n, m$  with  
 | 0, 0  $\Rightarrow$  Eq  
 | 0, S  $- \Rightarrow$  Lt  
 | S  $-, 0 \Rightarrow$  Gt  
 | S  $n', S\ m' \Rightarrow$  compare  $n'\ m'$   
 end.

Infix "?=" := compare (at level 70) : *nat\_scope*.

#### 10.1.4 Minimum, maximum

```
Fixpoint max n m :=
  match n, m with
  | 0, _ => m
  | S n', 0 => n
  | S n', S m' => S (max n' m')
  end.
```

```
Fixpoint min n m :=
  match n, m with
  | 0, _ => 0
  | S n', 0 => 0
  | S n', S m' => S (min n' m')
  end.
```

#### 10.1.5 Parity tests

```
Fixpoint even n : bool :=
  match n with
  | 0 => true
  | 1 => false
  | S (S n') => even n'
  end.
```

Definition odd n := negb (even n).

#### 10.1.6 Power

```
Fixpoint pow n m :=
  match m with
  | 0 => 1
  | S m => n × (n^m)
  end
```

where "n ^ m" := (pow n m) : nat\_scope.

#### 10.1.7 Euclidean division

This division is linear and tail-recursive. In *divmod*, *y* is the predecessor of the actual divisor, and *u* is *y* minus the real remainder

```
Fixpoint divmod x y q u :=
  match x with
  | 0 => (q, u)
  | S x' => match u with
    | 0 => divmod x' y (S q) y
    | S u' => divmod x' y q u'
```

```

        end
    end.

Definition div x y :=
  match y with
  | 0 => y
  | S y' => fst (divmod x y' 0 y')
  end.

Definition modulo x y :=
  match y with
  | 0 => y
  | S y' => y' - snd (divmod x y' 0 y')
  end.

Infix "/" := div : nat_scope.
Infix "mod" := modulo (at level 40, no associativity) : nat_scope.

```

### 10.1.8 Greatest common divisor

We use Euclid algorithm, which is normally not structural, but Coq is now clever enough to accept this (behind modulo there is a subtraction, which now preserves being a subterm)

```

Fixpoint gcd a b :=
  match a with
  | 0 => b
  | S a' => gcd (b mod (S a')) (S a')
  end.

```

### 10.1.9 Square

```

Definition square n := n × n.

```

### 10.1.10 Square root

The following square root function is linear (and tail-recursive). With Peano representation, we can't do better. For faster algorithm, see Psqrt/Zsqrt/Nsqrt...

We search the square root of  $n = k + p^2 + (q - r)$  with  $q = 2p$  and  $0 \leq r \leq q$ . We start with  $p=q=r=0$ , hence looking for the square root of  $n = k$ . Then we progressively decrease  $k$  and  $r$ . When  $k = S k'$  and  $r=0$ , it means we can use  $(S p)$  as new sqrt candidate, since  $(S k') + p^2 + 2p = k' + (S p)^2$ . When  $k$  reaches 0, we have found the biggest  $p^2$  square contained in  $n$ , hence the square root of  $n$  is  $p$ .

```

Fixpoint sqrt_iter k p q r :=
  match k with
  | 0 => p
  | S k' => match r with
    | 0 => sqrt_iter k' (S p) (S (S q)) (S (S q))
    | S r' => sqrt_iter k' p q r'
  end
end

```

end.

Definition `sqrt`  $n := \text{sqrt\_iter } n \ 0 \ 0 \ 0$ .

### 10.1.11 Log2

This base-2 logarithm is linear and tail-recursive.

In `log2_iter`, we maintain the logarithm  $p$  of the counter  $q$ , while  $r$  is the distance between  $q$  and the next power of 2, more precisely  $q + S \ r = 2^{(S \ p)}$  and  $r < 2^p$ . At each recursive call,  $q$  goes up while  $r$  goes down. When  $r$  is 0, we know that  $q$  has almost reached a power of 2, and we increase  $p$  at the next call, while resetting  $r$  to  $q$ .

Graphically (numbers are  $q$ , stars are  $r$ ) :

We stop when  $k$ , the global downward counter reaches 0. At that moment,  $q$  is the number we're considering (since  $k+q$  is invariant), and  $p$  its logarithm.

```

Fixpoint log2_iter k p q r :=
  match k with
  | 0 => p
  | S k' => match r with
            | 0 => log2_iter k' (S p) (S q) q
            | S r' => log2_iter k' p (S q) r'
          end
  end.

```

Definition `log2`  $n := \text{log2\_iter } (\text{pred } n) \ 0 \ 1 \ 0$ .

Iterator on natural numbers

```

Definition iter (n:nat) {A} (f:A→A) (x:A) : A :=
  nat_rect (fun _ => A) x (fun _ => f) n.

```

Bitwise operations

We provide here some bitwise operations for unary numbers. Some might be really naive, they are just there for fulfilling the same interface as other for natural representations. As soon as binary representations such as `NArith` are available, it is clearly better to convert to/from them and use their ops.

```

Fixpoint div2 n :=

```

```

    match  $n$  with
    | 0  $\Rightarrow$  0
    | S 0  $\Rightarrow$  0
    | S (S  $n'$ )  $\Rightarrow$  S (div2  $n'$ )
    end.

Fixpoint testbit  $a$   $n$  : bool :=
  match  $n$  with
  | 0  $\Rightarrow$  odd  $a$ 
  | S  $n$   $\Rightarrow$  testbit (div2  $a$ )  $n$ 
  end.

Definition shiftl  $a$  := nat_rect _  $a$  (fun _  $\Rightarrow$  double).
Definition shiftr  $a$  := nat_rect _  $a$  (fun _  $\Rightarrow$  div2).

Fixpoint bitwise ( $op$ :bool $\rightarrow$ bool $\rightarrow$ bool)  $n$   $a$   $b$  :=
  match  $n$  with
  | 0  $\Rightarrow$  0
  | S  $n'$   $\Rightarrow$ 
    (if  $op$  (odd  $a$ ) (odd  $b$ ) then 1 else 0) +
    2*(bitwise  $op$   $n'$  (div2  $a$ ) (div2  $b$ ))
  end.

Definition land  $a$   $b$  := bitwise andb  $a$   $a$   $b$ .
Definition lor  $a$   $b$  := bitwise orb (max  $a$   $b$ )  $a$   $b$ .
Definition ldiff  $a$   $b$  := bitwise (fun  $b$   $b'$   $\Rightarrow$  andb  $b$  (negb  $b'$ ))  $a$   $a$   $b$ .
Definition lxor  $a$   $b$  := bitwise xorb (max  $a$   $b$ )  $a$   $b$ .

```

# Chapter 11

## Library **Coq.Logic.Berardi**

This file formalizes Berardi's paradox which says that in the calculus of constructions, excluded middle (EM) and axiom of choice (AC) imply proof irrelevance (PI). Here, the axiom of choice is not necessary because of the use of inductive types.

```
@article{Barbanera-Berardi:JFP96,  
  author    = {F. Barbanera and S. Berardi},  
  title     = {Proof-irrelevance out of Excluded-middle and Choice  
              in the Calculus of Constructions},  
  journal   = {Journal of Functional Programming},  
  year      = {1996},  
  volume    = {6},  
  number    = {3},  
  pages     = {519-525}  
}
```

**Set Implicit Arguments.**

**Section Berardis\_paradox.**

Excluded middle **Hypothesis**  $EM : \forall P:\text{Prop}, P \vee \neg P$ .

Conditional on any proposition. **Definition**  $\text{IFProp} (P B:\text{Prop}) (e1 e2:P) :=$   
**match**  $EM\ B$  **with**  
| **or\_introl**  $_ \Rightarrow e1$   
| **or\_intror**  $_ \Rightarrow e2$   
**end.**

Axiom of choice applied to disjunction. Provable in Coq because of dependent elimination.

**Lemma**  $\text{AC\_IF} :$

$\forall (P B:\text{Prop}) (e1 e2:P) (Q:P \rightarrow \text{Prop}),$   
 $(B \rightarrow Q\ e1) \rightarrow (\neg B \rightarrow Q\ e2) \rightarrow Q\ (\text{IFProp}\ B\ e1\ e2).$

We assume a type with two elements. They play the role of booleans. The main theorem under the current assumptions is that  $T=F$  **Variable**  $Bool : \text{Prop}$ .

**Variable**  $T : Bool$ .

**Variable**  $F : Bool$ .

The powerset operator **Definition**  $\text{pow} (P:\text{Prop}) := P \rightarrow \text{Bool}$ .

A piece of theory about retracts **Section** **Retracts**.

**Variables**  $A B : \text{Prop}$ .

**Record** **retract** :  $\text{Prop} :=$

$\{i : A \rightarrow B; j : B \rightarrow A; \text{inv} : \forall a:A, j (i a) = a\}$ .

**Record** **retract\_cond** :  $\text{Prop} :=$

$\{i2 : A \rightarrow B; j2 : B \rightarrow A; \text{inv2} : \text{retract} \rightarrow \forall a:A, j2 (i2 a) = a\}$ .

The dependent elimination above implies the axiom of choice:

**Lemma** **AC** :  $\forall r:\text{retract\_cond}, \text{retract} \rightarrow \forall a:A, r.(j2) (r.(i2) a) = a$ .

**End** **Retracts**.

This lemma is basically a commutation of implication and existential quantification:  $(\exists x \mid A \rightarrow P(x)) \Leftrightarrow (A \rightarrow \exists x \mid P(x))$  which is provable in classical logic ( $\Rightarrow$  is already provable in intuitionistic logic).

**Lemma** **L1** :  $\forall A B:\text{Prop}, \text{retract\_cond} (\text{pow } A) (\text{pow } B)$ .

The paradoxical set **Definition**  $U := \forall P:\text{Prop}, \text{pow } P$ .

Bijection between  $U$  and  $(\text{pow } U)$  **Definition**  $f (u:U) : \text{pow } U := u U$ .

**Definition**  $g (h:\text{pow } U) : U :=$

$\text{fun } X \Rightarrow \text{let } lX := j2 (L1 X U) \text{ in let } rU := i2 (L1 U U) \text{ in } lX (rU h)$ .

We deduce that the powerset of  $U$  is a retract of  $U$ . This lemma is stated in Berardi's article, but is not used afterwards. **Lemma** **retract\_pow\_U\_U** :  $\text{retract} (\text{pow } U) U$ .

Encoding of Russel's paradox

The boolean negation. **Definition** **Not\_b**  $(b:\text{Bool}) := \text{IFProp} (b = T) F T$ .

the set of elements not belonging to itself **Definition** **R** :  $U := g (\text{fun } u:U \Rightarrow \text{Not\_b } (u U u))$ .

**Lemma** **not\_has\_fixpoint** :  $R R = \text{Not\_b } (R R)$ .

**Theorem** **classical\_proof\_irrelevance** :  $T = F$ .

**End** **Berardis\_paradox**.

## Chapter 12

# Library `Coq.Logic.ChoiceFacts`

Some facts and definitions concerning choice and description in intuitionistic logic.

We investigate the relations between the following choice and description principles

- `AC_rel` = relational form of the (non extensional) axiom of choice (a “set-theoretic” axiom of choice)
- `AC_fun` = functional form of the (non extensional) axiom of choice (a “type-theoretic” axiom of choice)
- `DC_fun` = functional form of the dependent axiom of choice
- `ACw_fun` = functional form of the countable axiom of choice
- `AC!` = functional relation reification (known as axiom of unique choice in topos theory, sometimes called principle of definite description in the context of constructive type theory)
- `GAC_rel` = guarded relational form of the (non extensional) axiom of choice
- `GAC_fun` = guarded functional form of the (non extensional) axiom of choice
- `GAC!` = guarded functional relation reification
- `OAC_rel` = “omniscient” relational form of the (non extensional) axiom of choice
- `OAC_fun` = “omniscient” functional form of the (non extensional) axiom of choice (called `AC*` in Bell [*Bell*])
- `OAC!`
- `ID_iota` = intuitionistic definite description
- `ID_epsilon` = intuitionistic indefinite description
- `D_iota` = (weakly classical) definite description principle
- `D_epsilon` = (weakly classical) indefinite description principle
- `PI` = proof irrelevance

- IGP = independence of general premises (an unconstrained generalisation of the constructive principle of independence of premises)
- Drinker = drinker's paradox (small form) (called Ex in Bell [*Bell*])

We let also

- IPL<sub>2</sub> = 2nd-order impredicative minimal predicate logic (with ex. quant.)
- IPL<sup>2</sup> = 2nd-order functional minimal predicate logic (with ex. quant.)
- IPL<sub>2</sub><sup>2</sup> = 2nd-order impredicative, 2nd-order functional minimal pred. logic (with ex. quant.)

with no prerequisite on the non-emptiness of domains

## 12.1 Definitions

Choice, reification and description schemes

We make them all polymorphic. Most of them have existentials as conclusion so they require polymorphism otherwise their first application (e.g. to an existential in **Set**) will fix the level of *A*.

**Section ChoiceSchemes.**

**Variables** *A B* :Type.

**Variable** *P* :*A*→Prop.

**Variable** *R* :*A*→*B*→Prop.

### 12.1.1 Constructive choice and description

AC\_rel

**Definition** RelationalChoice\_on :=

$$\begin{aligned} & \forall R:A \rightarrow B \rightarrow \text{Prop}, \\ & (\forall x:A, \exists y:B, R\ x\ y) \rightarrow \\ & (\exists R':A \rightarrow B \rightarrow \text{Prop}, \text{subrelation } R' \ R \wedge \forall x, \exists! y, R'\ x\ y). \end{aligned}$$

AC\_fun

**Definition** FunctionalChoice\_on :=

$$\begin{aligned} & \forall R:A \rightarrow B \rightarrow \text{Prop}, \\ & (\forall x:A, \exists y:B, R\ x\ y) \rightarrow \\ & (\exists f:A \rightarrow B, \forall x:A, R\ x\ (f\ x)). \end{aligned}$$

DC\_fun

**Definition** FunctionalDependentChoice\_on :=

$$\begin{aligned} & \forall (R:A \rightarrow A \rightarrow \text{Prop}), \\ & (\forall x, \exists y, R\ x\ y) \rightarrow \forall x0, \\ & (\exists f:\text{nat} \rightarrow A, f\ 0 = x0 \wedge \forall n, R\ (f\ n)\ (f\ (\text{S } n))). \end{aligned}$$

ACw\_fun

**Definition** FunctionalCountableChoice\_on :=

$$\begin{aligned} & \forall (R:\text{nat} \rightarrow A \rightarrow \text{Prop}), \\ & (\forall n, \exists y, R\ n\ y) \rightarrow \\ & (\exists f:\text{nat} \rightarrow A, \forall n, R\ n\ (f\ n)). \end{aligned}$$

AC! or Functional Relation Reification (known as Axiom of Unique Choice in topos theory; also called principle of definite description

**Definition** FunctionalRelReification\_on :=

$$\begin{aligned} & \forall R:A \rightarrow B \rightarrow \text{Prop}, \\ & (\forall x:A, \exists! y:B, R\ x\ y) \rightarrow \\ & (\exists f:A \rightarrow B, \forall x:A, R\ x\ (f\ x)). \end{aligned}$$

ID\_epsilon (constructive version of indefinite description; combined with proof-irrelevance, it may be connected to Carlström's type theory with a constructive indefinite description operator)

**Definition** ConstructiveIndefiniteDescription\_on :=

$$\begin{aligned} & \forall P:A \rightarrow \text{Prop}, \\ & (\exists x, P\ x) \rightarrow \{x:A \mid P\ x\}. \end{aligned}$$

ID\_iota (constructive version of definite description; combined with proof-irrelevance, it may be connected to Carlström's and Stenlund's type theory with a constructive definite description operator)

**Definition** ConstructiveDefiniteDescription\_on :=

$$\begin{aligned} & \forall P:A \rightarrow \text{Prop}, \\ & (\exists! x, P\ x) \rightarrow \{x:A \mid P\ x\}. \end{aligned}$$

### 12.1.2 Weakly classical choice and description

GAC\_rel

**Definition** GuardedRelationalChoice\_on :=  
 $\forall P : A \rightarrow \text{Prop}, \forall R : A \rightarrow B \rightarrow \text{Prop},$   
 $(\forall x : A, P x \rightarrow \exists y : B, R x y) \rightarrow$   
 $(\exists R' : A \rightarrow B \rightarrow \text{Prop},$   
 $\text{subrelation } R' R \wedge \forall x, P x \rightarrow \exists! y, R' x y).$   
GAC\_fun

**Definition** GuardedFunctionalChoice\_on :=  
 $\forall P : A \rightarrow \text{Prop}, \forall R : A \rightarrow B \rightarrow \text{Prop},$   
 $\text{inhabited } B \rightarrow$   
 $(\forall x : A, P x \rightarrow \exists y : B, R x y) \rightarrow$   
 $(\exists f : A \rightarrow B, \forall x, P x \rightarrow R x (f x)).$   
GFR\_fun

**Definition** GuardedFunctionalRelReification\_on :=  
 $\forall P : A \rightarrow \text{Prop}, \forall R : A \rightarrow B \rightarrow \text{Prop},$   
 $\text{inhabited } B \rightarrow$   
 $(\forall x : A, P x \rightarrow \exists! y : B, R x y) \rightarrow$   
 $(\exists f : A \rightarrow B, \forall x : A, P x \rightarrow R x (f x)).$   
OAC\_rel

**Definition** OmniscientRelationalChoice\_on :=  
 $\forall R : A \rightarrow B \rightarrow \text{Prop},$   
 $\exists R' : A \rightarrow B \rightarrow \text{Prop},$   
 $\text{subrelation } R' R \wedge \forall x : A, (\exists y : B, R x y) \rightarrow \exists! y, R' x y.$   
OAC\_fun

**Definition** OmniscientFunctionalChoice\_on :=  
 $\forall R : A \rightarrow B \rightarrow \text{Prop},$   
 $\text{inhabited } B \rightarrow$   
 $\exists f : A \rightarrow B, \forall x : A, (\exists y : B, R x y) \rightarrow R x (f x).$   
D\_epsilon

**Definition** EpsilonStatement\_on :=  
 $\forall P : A \rightarrow \text{Prop},$   
 $\text{inhabited } A \rightarrow \{ x : A \mid (\exists x, P x) \rightarrow P x \}.$   
D\_iota

**Definition** IotaStatement\_on :=  
 $\forall P : A \rightarrow \text{Prop},$   
 $\text{inhabited } A \rightarrow \{ x : A \mid (\exists! x, P x) \rightarrow P x \}.$

**End** ChoiceSchemes.

 $(Q \rightarrow \exists x, P\ x) \rightarrow \exists x, Q \rightarrow P\ x.$   
**Definition** SmallDrinker'sParadox :=  
 $\forall (A:\text{Type}) (P:A \rightarrow \text{Prop}), \text{inhabited } A \rightarrow$   
 $\exists x, (\exists x, P\ x) \rightarrow P\ x.$

## 12.2 AC\_rel + AC! = AC\_fun

We show that the functional formulation of the axiom of Choice (usual formulation in type theory) is equivalent to its relational formulation (only formulation of set theory) + functional relation reification (aka axiom of unique choice, or, principle of (parametric) definite descriptions)

This shows that the axiom of choice can be assumed (under its relational formulation) without known inconsistency with classical logic, though functional relation reification conflicts with classical logic

**Lemma** `description_rel_choice_imp_func_choice` :

$\forall A B : \text{Type},$   
 $\text{FunctionalRelReification\_on } A B \rightarrow \text{RelationalChoice\_on } A B \rightarrow \text{FunctionalChoice\_on } A B.$

**Lemma** `func_choice_imp_rel_choice` :

$\forall A B : \text{Type}, \text{FunctionalChoice\_on } A B \rightarrow \text{RelationalChoice\_on } A B.$

**Lemma** `func_choice_imp_description` :

$\forall A B : \text{Type}, \text{FunctionalChoice\_on } A B \rightarrow \text{FunctionalRelReification\_on } A B.$

**Corollary** `FunChoice_Equiv_RelChoice_and_ParamDefinDescr` :

$\forall A B : \text{Type}, \text{FunctionalChoice\_on } A B \leftrightarrow$   
 $\text{RelationalChoice\_on } A B \wedge \text{FunctionalRelReification\_on } A B.$

## 12.3 Connection between the guarded, non guarded and omniscient choices

We show that the guarded formulations of the axiom of choice are equivalent to their “omniscient” variant and comes from the non guarded formulation in presence either of the independence of general premises or subset types (themselves derivable from subtypes thanks to proof- irrelevance)

### 12.3.1 $\text{AC\_rel} + \text{PI} \rightarrow \text{GAC\_rel}$ and $\text{AC\_rel} + \text{IGP} \rightarrow \text{GAC\_rel}$ and $\text{GAC\_rel} = \text{OAC\_rel}$

**Lemma** `rel_choice_and_proof_irrel_imp_guarded_rel_choice` :

$\text{RelationalChoice} \rightarrow \text{ProofIrrelevance} \rightarrow \text{GuardedRelationalChoice}.$

**Lemma** `rel_choice_indep_of_general_premises_imp_guarded_rel_choice` :

$\forall A B : \text{Type}, \text{inhabited } B \rightarrow \text{RelationalChoice\_on } A B \rightarrow$   
 $\text{IndependenceOfGeneralPremises} \rightarrow \text{GuardedRelationalChoice\_on } A B.$

**Lemma** `guarded_rel_choice_imp_rel_choice` :

$\forall A B : \text{Type}, \text{GuardedRelationalChoice\_on } A B \rightarrow \text{RelationalChoice\_on } A B.$

**Lemma** `subset_types_imp_guarded_rel_choice_iff_rel_choice` :

$\text{ProofIrrelevance} \rightarrow (\text{GuardedRelationalChoice} \leftrightarrow \text{RelationalChoice}).$

$\text{OAC\_rel} = \text{GAC\_rel}$

**Corollary** `guarded_iff_omniscient_rel_choice` :

$\text{GuardedRelationalChoice} \leftrightarrow \text{OmniscientRelationalChoice}.$

### 12.3.2 $\text{AC\_fun} + \text{IGP} = \text{GAC\_fun} = \text{OAC\_fun} = \text{AC\_fun} + \text{Drinker}$

$\text{AC\_fun} + \text{IGP} = \text{GAC\_fun}$

**Lemma** `guarded_fun_choice_imp_indep_of_general_premises` :

$\text{GuardedFunctionalChoice} \rightarrow \text{IndependenceOfGeneralPremises}.$

**Lemma** guarded\_fun\_choice\_imp\_fun\_choice :

GuardedFunctionalChoice  $\rightarrow$  FunctionalChoiceOnInhabitedSet.

**Lemma** fun\_choice\_and\_indep\_general\_prem\_imp\_guarded\_fun\_choice :

FunctionalChoiceOnInhabitedSet  $\rightarrow$  IndependenceOfGeneralPremises  
 $\rightarrow$  GuardedFunctionalChoice.

**Corollary** fun\_choice\_and\_indep\_general\_prem\_iff\_guarded\_fun\_choice :

FunctionalChoiceOnInhabitedSet  $\wedge$  IndependenceOfGeneralPremises  
 $\leftrightarrow$  GuardedFunctionalChoice.

AC\_fun + Drinker = OAC\_fun

This was already observed by Bell [*Bell*]

**Lemma** omniscient\_fun\_choice\_imp\_small\_drinker :

OmniscientFunctionalChoice  $\rightarrow$  SmallDrinker'sParadox.

**Lemma** omniscient\_fun\_choice\_imp\_fun\_choice :

OmniscientFunctionalChoice  $\rightarrow$  FunctionalChoiceOnInhabitedSet.

**Lemma** fun\_choice\_and\_small\_drinker\_imp\_omniscient\_fun\_choice :

FunctionalChoiceOnInhabitedSet  $\rightarrow$  SmallDrinker'sParadox  
 $\rightarrow$  OmniscientFunctionalChoice.

**Corollary** fun\_choice\_and\_small\_drinker\_iff\_omniscient\_fun\_choice :

FunctionalChoiceOnInhabitedSet  $\wedge$  SmallDrinker'sParadox  
 $\leftrightarrow$  OmniscientFunctionalChoice.

OAC\_fun = GAC\_fun

This is derivable from the intuitionistic equivalence between IGP and Drinker but we give a direct proof

**Theorem** guarded\_iff\_omniscient\_fun\_choice :

GuardedFunctionalChoice  $\leftrightarrow$  OmniscientFunctionalChoice.

### 12.3.3 D\_iota $\rightarrow$ ID\_iota and D\_epsilon $\leftrightarrow$ ID\_epsilon + Drinker

D\_iota  $\rightarrow$  ID\_iota

**Lemma** iota\_imp\_constructive\_definite\_description :

IotaStatement  $\rightarrow$  ConstructiveDefiniteDescription.

ID\_epsilon + Drinker  $\leftrightarrow$  D\_epsilon

**Lemma** epsilon\_imp\_constructive\_indefinite\_description:

EpsilonStatement  $\rightarrow$  ConstructiveIndefiniteDescription.

**Lemma** constructive\_indefinite\_description\_and\_small\_drinker\_imp\_epsilon :

SmallDrinker'sParadox  $\rightarrow$  ConstructiveIndefiniteDescription  $\rightarrow$   
EpsilonStatement.

**Lemma** epsilon\_imp\_small\_drinker :

EpsilonStatement  $\rightarrow$  SmallDrinker'sParadox.

**Theorem** constructive\_indefinite\_description\_and\_small\_drinker\_iff\_epsilon :

(SmallDrinker'sParadox  $\times$  ConstructiveIndefiniteDescription  $\rightarrow$

EpsilonStatement) ×  
 (EpsilonStatement →  
 SmallDrinker'sParadox × ConstructiveIndefiniteDescription).

## 12.4 Derivability of choice for decidable relations with well-ordered codomain

Countable codomains, such as *nat*, can be equipped with a well-order, which implies the existence of a least element on inhabited decidable subsets. As a consequence, the relational form of the axiom of choice is derivable on *nat* for decidable relations.

We show instead that functional relation reification and the functional form of the axiom of choice are equivalent on decidable relation with *nat* as codomain

**Require Import** Wf\_nat.

**Require Import** Decidable.

**Definition** FunctionalChoice\_on\_rel (A B:Type) (R:A→B→Prop) :=  
 (∀ x:A, ∃ y : B, R x y) →  
 ∃ f : A → B, (∀ x:A, R x (f x)).

**Lemma** classical\_denumerable\_description\_imp\_fun\_choice :

∀ A:Type,  
 FunctionalRelReification\_on A nat →  
 ∀ R:A→nat→Prop,  
 (∀ x y, decidable (R x y)) → FunctionalChoice\_on\_rel R.

## 12.5 Choice on dependent and non dependent function types are equivalent

### 12.5.1 Choice on dependent and non dependent function types are equivalent

**Definition** DependentFunctionalChoice\_on (A:Type) (B:A → Type) :=  
 ∀ R:∀ x:A, B x → Prop,  
 (∀ x:A, ∃ y : B x, R x y) →  
 (∃ f : (∀ x:A, B x), ∀ x:A, R x (f x)).

**Notation** DependentFunctionalChoice :=

(∀ A (B:A→Type), DependentFunctionalChoice\_on B).

The easy part

**Theorem** dep\_non\_dep\_functional\_choice :

DependentFunctionalChoice → FunctionalChoice.

Deriving choice on product types requires some computation on singleton propositional types, so we need computational conjunction projections and dependent elimination of conjunction and equality

**Scheme** and\_indd := Induction for and Sort Prop.

**Scheme** eq\_indd := Induction for eq Sort Prop.

**Definition** `proj1_inf (A B:Prop) (p : A ∧ B) :=  
 let (a,b) := p in a.`

**Theorem** `non_dep_dep_functional_choice :`  
`FunctionalChoice → DependentFunctionalChoice.`

## 12.5.2 Reification of dependent and non dependent functional relation are equivalent

**Definition** `DependentFunctionalRelReification_on (A:Type) (B:A → Type) :=  
 ∀ (R:∀ x:A, B x → Prop),  
 (∀ x:A, ∃! y : B x, R x y) →  
 (∃ f : (∀ x:A, B x), ∀ x:A, R x (f x)).`

**Notation** `DependentFunctionalRelReification :=  
 (∀ A (B:A→Type), DependentFunctionalRelReification_on B).`

The easy part

**Theorem** `dep_non_dep_functional_rel_reification :`  
`DependentFunctionalRelReification → FunctionalRelReification.`

Deriving choice on product types requires some computation on singleton propositional types, so we need computational conjunction projections and dependent elimination of conjunction and equality

**Theorem** `non_dep_dep_functional_rel_reification :`  
`FunctionalRelReification → DependentFunctionalRelReification.`

**Corollary** `dep_iff_non_dep_functional_rel_reification :`  
`FunctionalRelReification ↔ DependentFunctionalRelReification.`

## 12.6 Non contradiction of constructive descriptions wrt functional axioms of choice

### 12.6.1 Non contradiction of indefinite description

**Lemma** `relative_non_contradiction_of_indefinite_descr :`  
`∀ C:Prop, (ConstructiveIndefiniteDescription → C)  
 → (FunctionalChoice → C).`

**Lemma** `constructive_indefinite_descr_fun_choice :`  
`ConstructiveIndefiniteDescription → FunctionalChoice.`

### 12.6.2 Non contradiction of definite description

**Lemma** `relative_non_contradiction_of_definite_descr :`  
`∀ C:Prop, (ConstructiveDefiniteDescription → C)  
 → (FunctionalRelReification → C).`

**Lemma** `constructive_definite_descr_fun_reification :`

ConstructiveDefiniteDescription  $\rightarrow$  FunctionalRelReification.

Remark, the following corollaries morally hold:

Definition In\_propositional\_context (A:Type) := forall C:Prop, (A  $\rightarrow$  C)  $\rightarrow$  C.

Corollary constructive\_definite\_descr\_in\_prop\_context\_iff\_fun\_reification : In\_propositional\_context ConstructiveIndefiniteDescription  $\leftrightarrow$  FunctionalChoice.

Corollary constructive\_definite\_descr\_in\_prop\_context\_iff\_fun\_reification : In\_propositional\_context ConstructiveDefiniteDescription  $\leftrightarrow$  FunctionalRelReification.

but expecting *FunctionalChoice* (resp. *FunctionalRelReification*) to be applied on the same Type universes on both sides of the first (resp. second) equivalence breaks the stratification of universes.

## 12.7 Excluded-middle + definite description $\Rightarrow$ computational excluded-middle

The idea for the following proof comes from [ChicliPottierSimpson02]

Classical logic and axiom of unique choice (i.e. functional relation reification), as shown in [ChicliPottierSimpson02], implies the double-negation of excluded-middle in **Set** (which is incompatible with the impredicativity of **Set**).

We adapt the proof to show that constructive definite description transports excluded-middle from **Prop** to **Set**.

Theorem functional\_dependent\_choice\_imp\_functional\_countable\_choice :

FunctionalDependentChoice  $\rightarrow$  FunctionalCountableChoice.

## Chapter 13

# Library `Coq.Logic.ClassicalChoice`

This file provides classical logic and functional choice; this especially provides both indefinite descriptions and choice functions but this is weaker than providing epsilon operator and classical logic as the indefinite descriptions provided by the axiom of choice can be used only in a propositional context (especially, they cannot be used to build choice functions outside the scope of a theorem proof)

This file extends `ClassicalUniqueChoice.v` with full choice. As `ClassicalUniqueChoice.v`, it implies the double-negation of excluded-middle in `Set` and leads to a classical world populated with non computable functions. Especially it conflicts with the impredicativity of `Set`, knowing that *true*≠*false* in `Set`.

```
Require Export ClassicalUniqueChoice.
```

```
Require Export RelationalChoice.
```

```
Require Import ChoiceFacts.

  (∃ x : A, P x) → ∃ P' : A→Prop, subset P' P ∧ ∃! x, P' x.
```

```
Theorem choice :
```

```
  ∀ (A B : Type) (R : A→B→Prop),  
  (∀ x : A, ∃ y : B, R x y) →  
  ∃ f : A→B, (∀ x : A, R x (f x)).
```

## Chapter 14

# Library `Coq.Logic.ClassicalDescription`

This file provides classical logic and definite description, which is equivalent to providing classical logic and Church’s iota operator

Classical logic and definite descriptions implies excluded-middle in `Set` and leads to a classical world populated with non computable functions. It conflicts with the impredicativity of `Set`

`Set Implicit Arguments.`

`Require Export Classical. Require Export Description. Require Import ChoiceFacts.`

The idea for the following proof comes from *ChicliPottierSimpson02*

**Theorem** `excluded_middle_informative` :  $\forall P:\text{Prop}, \{P\} + \{\neg P\}$ .

**Theorem** `classical_definite_description` :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}), \text{inhabited } A \rightarrow$   
 $\{x : A \mid (\exists! x : A, P x) \rightarrow P x\}.$

Church’s iota operator

**Definition** `iota`  $(A : \text{Type}) (i:\text{inhabited } A) (P : A \rightarrow \text{Prop}) : A$   
 $:= \text{proj1\_sig } (\text{classical\_definite\_description } P i).$

**Definition** `iota_spec`  $(A : \text{Type}) (i:\text{inhabited } A) (P : A \rightarrow \text{Prop}) :$   
 $(\exists! x:A, P x) \rightarrow P (\text{iota } i P)$   
 $:= \text{proj2\_sig } (\text{classical\_definite\_description } P i).$

Axiom of unique “choice” (functional reification of functional relations) **Theorem** `dependent_unique_choice` :

$\forall (A:\text{Type}) (B:A \rightarrow \text{Type}) (R:\forall x:A, B x \rightarrow \text{Prop}),$   
 $(\forall x:A, \exists! y : B x, R x y) \rightarrow$   
 $(\exists f : (\forall x:A, B x), \forall x:A, R x (f x)).$

**Theorem** `unique_choice` :

$\forall (A B:\text{Type}) (R:A \rightarrow B \rightarrow \text{Prop}),$   
 $(\forall x:A, \exists! y : B, R x y) \rightarrow$   
 $(\exists f : A \rightarrow B, \forall x:A, R x (f x)).$

Compatibility lemmas

`Unset Implicit Arguments.`

**Definition** `dependent_description` := `dependent_unique_choice`.  
**Definition** `description` := `unique_choice`.

## Chapter 15

# Library Coq.Logic.ClassicalEpsilon

This file provides classical logic and indefinite description under the form of Hilbert's epsilon operator

Hilbert's epsilon operator and classical logic implies excluded-middle in **Set** and leads to a classical world populated with non computable functions. It conflicts with the impredicativity of **Set**

**Require Export** Classical.

**Require Import** ChoiceFacts.

**Set Implicit Arguments.**

**Axiom** *constructive\_indefinite\_description* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}),$   
 $(\exists x, P x) \rightarrow \{ x : A \mid P x \}.$

**Lemma** *constructive\_definite\_description* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}),$   
 $(\exists! x, P x) \rightarrow \{ x : A \mid P x \}.$

**Theorem** *excluded\_middle\_informative* :  $\forall P : \text{Prop}, \{P\} + \{\neg P\}.$

**Theorem** *classical\_indefinite\_description* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}), \text{inhabited } A \rightarrow$   
 $\{ x : A \mid (\exists x, P x) \rightarrow P x \}.$

Hilbert's epsilon operator

**Definition** *epsilon* ( $A : \text{Type}$ ) ( $i : \text{inhabited } A$ ) ( $P : A \rightarrow \text{Prop}$ ) :  $A$   
:= *proj1\_sig* (*classical\_indefinite\_description*  $P$   $i$ ).

**Definition** *epsilon\_spec* ( $A : \text{Type}$ ) ( $i : \text{inhabited } A$ ) ( $P : A \rightarrow \text{Prop}$ ) :  
 $(\exists x, P x) \rightarrow P$  (*epsilon*  $i$   $P$ )  
:= *proj2\_sig* (*classical\_indefinite\_description*  $P$   $i$ ).

Open question: is *classical\_indefinite\_description* constructively provable from *relational\_choice* and *constructive\_definite\_description* (at least, using the fact that *functional\_choice* is provable from *relational\_choice* and *unique\_choice*, we know that the double negation of *classical\_indefinite\_description* is provable (see *relative\_non\_contradiction\_of\_indefinite\_desc*).

A proof that if  $P$  is inhabited, *epsilon*  $a$   $P$  does not depend on the actual proof that the domain of  $P$  is inhabited (proof idea kindly provided by Pierre Cast  ran)

Lemma `epsilon_inh_irrelevance` :  
 $\forall (A:\text{Type}) (i\ j : \text{inhabited } A) (P:A\rightarrow\text{Prop}),$   
 $(\exists x, P\ x) \rightarrow \text{epsilon } i\ P = \text{epsilon } j\ P.$   
 Opaque `epsilon`.

**Weaker lemmas (compatibility lemmas)**

Theorem `choice` :  
 $\forall (A\ B : \text{Type}) (R : A\rightarrow B\rightarrow\text{Prop}),$   
 $(\forall x : A, \exists y : B, R\ x\ y) \rightarrow$   
 $(\exists f : A\rightarrow B, \forall x : A, R\ x\ (f\ x)).$

# Chapter 16

## Library `Coq.Logic.ClassicalFacts`

Some facts and definitions about classical logic

Table of contents:

1. Propositional degeneracy = excluded-middle + propositional extensionality
2. Classical logic and proof-irrelevance
  - 2.1. CC |- prop. ext. + A inhabited -> (A = A->A) -> A has fixpoint
  - 2.2. CC |- prop. ext. + dep elim on bool -> proof-irrelevance
  - 2.3. CIC |- prop. ext. -> proof-irrelevance
  - 2.4. CC |- excluded-middle + dep elim on bool -> proof-irrelevance
  - 2.5. CIC |- excluded-middle -> proof-irrelevance
3. Weak classical axioms
  - 3.1. Weak excluded middle
  - 3.2. Gödel-Dummett axiom and right distributivity of implication over disjunction
  - 3 3. Independence of general premises and drinker's paradox

### 16.1 Prop degeneracy = excluded-middle + prop extensionality

i.e.  $(\forall A, A = \text{True} \vee A = \text{False}) \leftrightarrow (\forall A, A \vee \neg A) \wedge (\forall A B, (A \leftrightarrow B) \rightarrow A = B)$

*prop\_degeneracy* (also referred to as propositional completeness) asserts (up to consistency) that there are only two distinct formulas **Definition** `prop_degeneracy` :=  $\forall A:\text{Prop}, A = \text{True} \vee A = \text{False}$ .

*prop\_extensionality* asserts that equivalent formulas are equal **Definition** `prop_extensionality` :=  $\forall A B:\text{Prop}, (A \leftrightarrow B) \rightarrow A = B$ .

*excluded\_middle* asserts that we can reason by case on the truth or falsity of any formula **Definition** `excluded_middle` :=  $\forall A:\text{Prop}, A \vee \neg A$ .

We show *prop\_degeneracy*  $\leftrightarrow$  (*prop\_extensionality*  $\wedge$  *excluded\_middle*)

**Lemma** `prop-degen-ext` : `prop_degeneracy`  $\rightarrow$  `prop_extensionality`.

**Lemma** `prop-degen-em` : `prop_degeneracy`  $\rightarrow$  `excluded_middle`.

**Lemma** `prop_ext_em_degen` :

`prop_extensionality`  $\rightarrow$  `excluded_middle`  $\rightarrow$  `prop_degeneracy`.

A weakest form of propositional extensionality: extensionality for provable propositions only

**Definition** `provable_prop_extensionality` :=  $\forall A:\text{Prop}, A \rightarrow A = \text{True}$ .

**Lemma** `provable_prop_ext` :  
`prop_extensionality`  $\rightarrow$  `provable_prop_extensionality`.

## 16.2 Classical logic and proof-irrelevance

### 16.2.1 CC |- `prop_ext` + `A inhabited` $\rightarrow$ (`A = A $\rightarrow$ A`) $\rightarrow$ `A` has fixpoint

We successively show that:

`prop_extensionality` implies equality of  $A$  and  $A \rightarrow A$  for inhabited  $A$ , which implies the existence of a (trivial) retract from  $A \rightarrow A$  to  $A$  (just take the identity), which implies the existence of a fixpoint operator in  $A$  (e.g. take the Y combinator of lambda-calculus)

**Lemma** `prop_ext_A_eq_A_imp_A` :  
`prop_extensionality`  $\rightarrow \forall A:\text{Prop}, \text{inhabited } A \rightarrow (A \rightarrow A) = A$ .

**Record** `retract` ( $A B:\text{Prop}$ ) : `Prop` :=  
 $\{f1 : A \rightarrow B; f2 : B \rightarrow A; f1\_o\_f2 : \forall x:B, f1 (f2 x) = x\}$ .

**Lemma** `prop_ext_retract_A_A_imp_A` :  
`prop_extensionality`  $\rightarrow \forall A:\text{Prop}, \text{inhabited } A \rightarrow \text{retract } A (A \rightarrow A)$ .

**Record** `has_fixpoint` ( $A:\text{Prop}$ ) : `Prop` :=  
 $\{F : (A \rightarrow A) \rightarrow A; \text{Fix} : \forall f:A \rightarrow A, F f = f (F f)\}$ .

**Lemma** `ext_prop_fixpoint` :  
`prop_extensionality`  $\rightarrow \forall A:\text{Prop}, \text{inhabited } A \rightarrow \text{has\_fixpoint } A$ .

Remark: `prop_extensionality` can be replaced in lemma `ext_prop_fixpoint` by the weakest property `provable_prop_extensionality`.

### 16.2.2 CC |- `prop_ext` /\ `dep elim on bool` $\rightarrow$ `proof-irrelevance`

`proof_irrelevance` asserts equality of all proofs of a given formula **Definition** `proof_irrelevance` :=  
 $\forall (A:\text{Prop}) (a1 a2:A), a1 = a2$ .

Assume that we have booleans with the property that there is at most 2 booleans (which is equivalent to dependent case analysis). Consider the fixpoint of the negation function: it is either true or false by dependent case analysis, but also the opposite by fixpoint. Hence proof-irrelevance.

We then map equality of boolean proofs to proof irrelevance in all propositions.

**Section** `Proof_irrelevance_gen`.

**Variable** `bool` : `Prop`.

**Variable** `true` : `bool`.

**Variable** `false` : `bool`.

**Hypothesis** `bool_elim` :  $\forall C:\text{Prop}, C \rightarrow C \rightarrow \text{bool} \rightarrow C$ .

**Hypothesis**

`bool_elim_redl` :  $\forall (C:\text{Prop}) (c1 c2:C), c1 = \text{bool\_elim } C c1 c2 \text{ true}$ .

**Hypothesis**

`bool_elim_redr` :  $\forall (C:\text{Prop}) (c1 c2:C), c2 = \text{bool\_elim } C c1 c2 \text{ false}$ .

**Let** `bool_dep_induction` :=

```

 $\forall P:bool \rightarrow \mathbf{Prop}, P \text{ true} \rightarrow P \text{ false} \rightarrow \forall b:bool, P b.$ 
Lemma aux : prop_extensionality  $\rightarrow$  bool_dep_induction  $\rightarrow$  true = false.
Lemma ext_prop_dep_proof_irrel_gen :
  prop_extensionality  $\rightarrow$  bool_dep_induction  $\rightarrow$  proof_irrelevance.
End Proof_irrelevance_gen.

```

In the pure Calculus of Constructions, we can define the boolean proposition  $bool = (C:\mathbf{Prop})C \rightarrow C \rightarrow C$  but we cannot prove that it has at most 2 elements.

**Section** Proof\_irrelevance\_Prop\_Ext\_CC.

```

Definition BoolP :=  $\forall C:\mathbf{Prop}, C \rightarrow C \rightarrow C.$ 
Definition TrueP : BoolP := fun C c1 c2  $\Rightarrow$  c1.
Definition FalseP : BoolP := fun C c1 c2  $\Rightarrow$  c2.
Definition BoolP_elim C c1 c2 (b:BoolP) := b C c1 c2.
Definition BoolP_elim_redl (C:Prop) (c1 c2:C) :
  c1 = BoolP_elim C c1 c2 TrueP := eq_refl c1.
Definition BoolP_elim_redr (C:Prop) (c1 c2:C) :
  c2 = BoolP_elim C c1 c2 FalseP := eq_refl c2.
Definition BoolP_dep_induction :=
   $\forall P:\mathbf{Prop}, P \text{ TrueP} \rightarrow P \text{ FalseP} \rightarrow \forall b:\mathbf{Prop}, P b.$ 
Lemma ext_prop_dep_proof_irrel_cc :
  prop_extensionality  $\rightarrow$  BoolP_dep_induction  $\rightarrow$  proof_irrelevance.
End Proof_irrelevance_Prop_Ext_CC.

```

Remark: *prop\_extensionality* can be replaced in lemma *ext\_prop\_dep\_proof\_irrel\_gen* by the weakest property *provable\_prop\_extensionality*.

### 16.2.3 CIC |- prop. ext. $\rightarrow$ proof-irrelevance

In the Calculus of Inductive Constructions, inductively defined booleans enjoy dependent case analysis, hence directly proof-irrelevance from propositional extensionality.

**Section** Proof\_irrelevance\_CIC.

```

Inductive boolP : Prop :=
| trueP : boolP
| falseP : boolP.
Definition boolP_elim_redl (C:Prop) (c1 c2:C) :
  c1 = boolP_ind C c1 c2 trueP := eq_refl c1.
Definition boolP_elim_redr (C:Prop) (c1 c2:C) :
  c2 = boolP_ind C c1 c2 falseP := eq_refl c2.
Scheme boolP_indd := Induction for boolP Sort Prop.
Lemma ext_prop_dep_proof_irrel_cic : prop_extensionality  $\rightarrow$  proof_irrelevance.
End Proof_irrelevance_CIC.

```

Can we state proof irrelevance from propositional degeneracy (i.e. propositional extensionality + excluded middle) without dependent case analysis ?

Berardi [Berardi90] built a model of CC interpreting inhabited types by the set of all untyped lambda-terms. This model satisfies propositional degeneracy without satisfying proof-irrelevance (nor dependent case analysis). This implies that the previous results cannot be refined.

[Berardi90] Stefano Berardi, “Type dependence and constructive mathematics”, Ph. D. thesis, Dipartimento Matematica, Università di Torino, 1990.

#### 16.2.4 CC |- excluded-middle + dep elim on bool -> proof-irrelevance

This is a proof in the pure Calculus of Construction that classical logic in **Prop** + dependent elimination of disjunction entails proof-irrelevance.

Reference:

[Coquand90] T. Coquand, “Metamathematical Investigations of a Calculus of Constructions”, Proceedings of Logic in Computer Science (LICS’90), 1990.

Proof skeleton: classical logic + dependent elimination of disjunction + discrimination of proofs implies the existence of a retract from **Prop** into *bool*, hence inconsistency by encoding any paradox of system U- (e.g. Hurkens’ paradox).

Require Import Hurkens.

Section Proof\_irrelevance\_EM\_CC.

Variable *or* : **Prop** → **Prop** → **Prop**.

Variable *or\_introl* : ∀ *A B*:**Prop**, *A* → *or A B*.

Variable *or\_intror* : ∀ *A B*:**Prop**, *B* → *or A B*.

Hypothesis *or\_elim* : ∀ *A B C*:**Prop**, (*A* → *C*) → (*B* → *C*) → *or A B* → *C*.

Hypothesis

*or\_elim\_redl* :

∀ (*A B C*:**Prop**) (*f*:*A* → *C*) (*g*:*B* → *C*) (*a*:*A*),  
*f a* = *or\_elim A B C f g (or\_introl A B a)*.

Hypothesis

*or\_elim\_redr* :

∀ (*A B C*:**Prop**) (*f*:*A* → *C*) (*g*:*B* → *C*) (*b*:*B*),  
*g b* = *or\_elim A B C f g (or\_intror A B b)*.

Hypothesis

*or\_dep\_elim* :

∀ (*A B*:**Prop**) (*P*:*or A B* → **Prop**),  
 (∀ *a*:*A*, *P (or\_introl A B a)*) →  
 (∀ *b*:*B*, *P (or\_intror A B b)*) → ∀ *b*:*or A B*, *P b*.

Hypothesis *em* : ∀ *A*:**Prop**, *or A* (¬ *A*).

Variable *B* : **Prop**.

Variables *b1 b2* : *B*.

**Hypothesis** `or_elim` :  $\forall A B C:\text{Prop}, (A \rightarrow C) \rightarrow (B \rightarrow C) \rightarrow \text{or } A B \rightarrow C$ .

**Hypothesis**

`or_elim_redl` :

$\forall (A B C:\text{Prop}) (f:A \rightarrow C) (g:B \rightarrow C) (a:A),$   
 $f a = \text{or\_elim } A B C f g (\text{or\_introl } A B a).$

**Hypothesis**

`or_elim_redr` :

$\forall (A B C:\text{Prop}) (f:A \rightarrow C) (g:B \rightarrow C) (b:B),$   
 $g b = \text{or\_elim } A B C f g (\text{or\_intror } A B b).$

**Hypothesis**

`or_dep_elim` :

$\forall (A B:\text{Prop}) (P:\text{or } A B \rightarrow \text{Prop}),$   
 $(\forall a:A, P (\text{or\_introl } A B a)) \rightarrow$   
 $(\forall b:B, P (\text{or\_intror } A B b)) \rightarrow \forall b:\text{or } A B, P b.$

**Hypothesis** `wem` :  $\forall A:\text{Prop}, \text{or } (\sim \sim A) (\neg A).$

**Variable** `B` : **Prop**.

**Variables** `b1 b2` : `B`.

`p2b` and `b2p` form a retract if  $\neg b1 = b2$

**Let** `p2b` (`A`:**NProp**) := `or_elim` (`~~El A`) (`~El A`) `B` (`fun _ => b1`) (`fun _ => b2`) (`wem (El A)`).

**Let** `b2p b` : **NProp** := `exist` (`fun P => ~ ~ P -> P`) (`~~(b1 = b)`) (`fun h x => h (fun k => k x)`).

**Lemma** `wp2p1` :  $\forall A:\text{NProp}, \text{El } A \rightarrow \text{El } (b2p (p2b A)).$

**Lemma** `wp2p2` :  $b1 \neq b2 \rightarrow \forall A:\text{NProp}, \text{El } (b2p (p2b A)) \rightarrow \text{El } A.$

By Hurkens's paradox, we get a weak form of proof irrelevance.

**Theorem** `wproof_irrelevance_cc` :  $\sim \sim (b1 = b2).$

**End** `Proof_irrelevance_WEM_CC`.

### 16.2.5 CIC |- excluded-middle -> proof-irrelevance

Since, dependent elimination is derivable in the Calculus of Inductive Constructions (CCI), we get proof-irrelevance from classical logic in the CCI.

### Section Proof\_irrelevance\_CCI.

Hypothesis  $em : \forall A:\text{Prop}, A \vee \neg A$ .

Definition  $or\_elim\_redl (A B C:\text{Prop}) (f:A \rightarrow C) (g:B \rightarrow C)$   
 $(a:A) : f a = or\_ind f g (or\_introl B a) := eq\_refl (f a)$ .

Definition  $or\_elim\_redr (A B C:\text{Prop}) (f:A \rightarrow C) (g:B \rightarrow C)$   
 $(b:B) : g b = or\_ind f g (or\_intror A b) := eq\_refl (g b)$ .

Scheme  $or\_indd := \text{Induction for or Sort Prop}$ .

Theorem  $proof\_irrelevance\_cci : \forall (B:\text{Prop}) (b1 b2:B), b1 = b2$ .

### End Proof\_irrelevance\_CCI.

The same holds with weak excluded middle. The proof is a little more involved, however.

### Section Weak\_proof\_irrelevance\_CCI.

Hypothesis  $wem : \forall A:\text{Prop}, \sim\sim A \vee \neg A$ .

Theorem  $wem\_proof\_irrelevance\_cci : \forall (B:\text{Prop}) (b1 b2:B), \sim\sim b1 = b2$ .

### End Weak\_proof\_irrelevance\_CCI.

Remark: in the Set-impredicative CCI, Hurkens' paradox still holds with *bool* in **Set** and since  $\neg true = false$  for *true* and *false* in *bool* from **Set**, we get the inconsistency of  $em : \forall A:\text{Prop}, \{A\} + \{\sim A\}$  in the Set-impredicative CCI.

## 16.3 Weak classical axioms

We show the following increasing in the strength of axioms:

- weak excluded-middle
- right distributivity of implication over disjunction and Gödel-Dummett axiom
- independence of general premises and drinker's paradox
- excluded-middle

### 16.3.1 Weak excluded-middle

The weak classical logic based on  $\sim\sim A \vee \neg A$  is referred to with name KC in {*ChagrovZakharyashev97* [*ChagrovZakharyashev97*] Alexander Chagrov and Michael Zakharyashev, "Modal Logic", Clarendon Press, 1997.

Definition  $weak\_excluded\_middle :=$   
 $\forall A:\text{Prop}, \sim\sim A \vee \neg A$ .

The interest in the equivalent variant *weak\_generalized\_excluded\_middle* is that it holds even in logic without a primitive *False* connective (like Gödel-Dummett axiom)

Definition  $weak\_generalized\_excluded\_middle :=$   
 $\forall A B:\text{Prop}, ((A \rightarrow B) \rightarrow B) \vee (A \rightarrow B)$ .

### 16.3.2 Gödel-Dummett axiom

$(A \rightarrow B) \vee (B \rightarrow A)$  is studied in [Dummett59] and is based on [Gödel33].

[Dummett59] Michael A. E. Dummett. “A Propositional Calculus with a Denumerable Matrix”, In the Journal of Symbolic Logic, Vol 24 No. 2(1959), pp 97-103.

[Gödel33] Kurt Gödel. “Zum intuitionistischen Aussagenkalkül”, Ergeb. Math. Koll. 4 (1933), pp. 34-38.

**Definition** `GodelDummett` :=  $\forall A B:\text{Prop}, (A \rightarrow B) \vee (B \rightarrow A)$ .

**Lemma** `excluded_middle_Godel_Dummett` : `excluded_middle`  $\rightarrow$  `GodelDummett`.

$(A \rightarrow B) \vee (B \rightarrow A)$  is equivalent to  $(C \rightarrow A \vee B) \rightarrow (C \rightarrow A) \vee (C \rightarrow B)$  (proof from [Dummett59])

**Definition** `RightDistributivityImplicationOverDisjunction` :=

$\forall A B C:\text{Prop}, (C \rightarrow A \vee B) \rightarrow (C \rightarrow A) \vee (C \rightarrow B)$ .

**Lemma** `Godel_Dummett_iff_right_distr_implication_over_disjunction` :

`GodelDummett`  $\leftrightarrow$  `RightDistributivityImplicationOverDisjunction`.

$(A \rightarrow B) \vee (B \rightarrow A)$  is stronger than the weak excluded middle

**Lemma** `Godel_Dummett_weak_excluded_middle` :

`GodelDummett`  $\rightarrow$  `weak_excluded_middle`.

### 16.3.3 Independence of general premises and drinker's paradox

Independence of general premises is the unconstrained, non constructive, version of the Independence of Premises as considered in [Troelstra73].

It is a generalization to predicate logic of the right distributivity of implication over disjunction (hence of Gödel-Dummett axiom) whose own constructive form (obtained by a restricting the third formula to be negative) is called Kreisel-Putnam principle [KreiselPutnam57].

[KreiselPutnam57], Georg Kreisel and Hilary Putnam. “Eine Unableitsbarkeitsbeweismethode für den intuitionistischen Aussagenkalkül”. Archiv für Mathematische Logik und Grundlagenforschung, 3:74- 78, 1957.

[Troelstra73], Anne Troelstra, editor. Metamathematical Investigation of Intuitionistic Arithmetic and Analysis, volume 344 of Lecture Notes in Mathematics, Springer-Verlag, 1973.

**Definition** `IndependenceOfGeneralPremises` :=

$\forall (A:\text{Type}) (P:A \rightarrow \text{Prop}) (Q:\text{Prop}),$   
 $\text{inhabited } A \rightarrow (Q \rightarrow \exists x, P x) \rightarrow \exists x, Q \rightarrow P x.$

**Lemma**

`independence_general_premises_right_distr_implication_over_disjunction` :  
`IndependenceOfGeneralPremises`  $\rightarrow$  `RightDistributivityImplicationOverDisjunction`.

**Lemma** `independence_general_premises_Godel_Dummett` :

`IndependenceOfGeneralPremises`  $\rightarrow$  `GodelDummett`.

Independence of general premises is equivalent to the drinker's paradox

**Definition** `DrinkerParadox` :=

$\forall (A:\text{Type}) (P:A \rightarrow \text{Prop}),$   
 $\text{inhabited } A \rightarrow \exists x, (\exists x, P x) \rightarrow P x.$

**Lemma** independence\_general\_premises\_drinker :

IndependenceOfGeneralPremises  $\leftrightarrow$  DrinkerParadox.

Independence of general premises is weaker than (generalized) excluded middle

Remark: generalized excluded middle is preferred here to avoid relying on the “ex falso quodlibet” property (i.e.  $False \rightarrow \forall A, A$ )

**Definition** generalized\_excluded\_middle :=

$\forall A B:\text{Prop}, A \vee (A \rightarrow B).$

**Lemma** excluded\_middle\_independence\_general\_premises :

generalized\_excluded\_middle  $\rightarrow$  DrinkerParadox.

# Chapter 19

## Library

## Coq.Logic.ClassicalUniqueChoice

This file provides classical logic and unique choice; this is weaker than providing iota operator and classical logic as the definite descriptions provided by the axiom of unique choice can be used only in a propositional context (especially, they cannot be used to build functions outside the scope of a theorem proof)

Classical logic and unique choice, as shown in [ChicliPottierSimpson02], implies the double-negation of excluded-middle in **Set**, hence it implies a strongly classical world. Especially it conflicts with the impredicativity of **Set**.

[ChicliPottierSimpson02] Laurent Chicli, Loïc Pottier, Carlos Simpson, Mathematical Quotients and Quotient Types in Coq, Proceedings of TYPES 2002, Lecture Notes in Computer Science 2646, Springer Verlag.

**Require Export** Classical.

**Axiom**

*dependent\_unique\_choice* :  
  $\forall (A:\text{Type}) (B:A \rightarrow \text{Type}) (R:\forall x:A, B\ x \rightarrow \text{Prop}),$   
  $(\forall x:A, \exists! y:B\ x, R\ x\ y) \rightarrow$   
  $(\exists f:(\forall x:A, B\ x), \forall x:A, R\ x\ (f\ x)).$

Unique choice reifies functional relations into functions

**Theorem** unique\_choice :

$\forall (A\ B:\text{Type}) (R:A \rightarrow B \rightarrow \text{Prop}),$   
  $(\forall x:A, \exists! y:B, R\ x\ y) \rightarrow$   
  $(\exists f:A \rightarrow B, \forall x:A, R\ x\ (f\ x)).$

The following proof comes from [ChicliPottierSimpson02] **Require Import** Setoid.

**Theorem** classic\_set\_in\_prop\_context :

$\forall C:\text{Prop}, ((\forall P:\text{Prop}, \{P\} + \{\neg P\}) \rightarrow C) \rightarrow C.$

## Chapter 20

# Library **Coq.Logic.Classical**

Classical Logic

**Require Export** Classical\_Prop.

**Require Export** Classical\_Pred\_Type.

## Chapter 21

# Library `Coq.Logic.ConstructiveEpsilon`

This provides with a proof of the constructive form of definite and indefinite descriptions for  $\Sigma^0_1$ -formulas (hereafter called “small” formulas), which infers the sigma-existence (i.e., **Type**-existence) of a witness to a decidable predicate over a countable domain from the regular existence (i.e., **Prop**-existence).

Coq does not allow case analysis on sort **Prop** when the goal is in not in **Prop**. Therefore, one cannot eliminate  $\exists n, P\ n$  in order to show  $\{n : \text{nat} \mid P\ n\}$ . However, one can perform a recursion on an inductive predicate in sort **Prop** so that the returning type of the recursion is in **Type**. This trick is described in Coq’Art book, Sect. 14.2.3 and 15.4. In particular, this trick is used in the proof of *Fix\_F* in the module `Coq.Init.Wf`. There, recursion is done on an inductive predicate *Acc* and the resulting type is in **Type**.

To find a witness of *P* constructively, we program the well-known linear search algorithm that tries *P* on all natural numbers starting from 0 and going up. Such an algorithm needs a suitable termination certificate. We offer two ways for providing this termination certificate: a direct one, based on an ad-hoc predicate called *before\_witness*, and another one based on the predicate *Acc*. For the first one we provide explicit and short proof terms.

Based on ideas from Benjamin Werner and Jean-François Monin

Contributed by Yevgeniy Makarov and Jean-François Monin

**Section** `ConstructiveIndefiniteGroundDescription_Direct`.

**Variable** *P* : `nat`  $\rightarrow$  **Prop**.

**Hypothesis** *P\_dec* :  $\forall n, \{P\ n\} + \{\sim(P\ n)\}$ .

The termination argument is *before\_witness n*, which says that any number before any witness (not necessarily the *x* of  $\exists x : A, P\ x$ ) makes the search eventually stops.

**Inductive** *before\_witness* (*n*:`nat`) : **Prop** :=

| **stop** : *P* *n*  $\rightarrow$  *before\_witness* *n*  
| **next** : *before\_witness* (**S** *n*)  $\rightarrow$  *before\_witness* *n*.

**Fixpoint** *O\_witness* (*n* : `nat`) : *before\_witness* *n*  $\rightarrow$  *before\_witness* 0 :=

**match** *n* **return** (*before\_witness* *n*  $\rightarrow$  *before\_witness* 0) **with**  
| 0  $\Rightarrow$  **fun** *b*  $\Rightarrow$  *b*  
| **S** *n*  $\Rightarrow$  **fun** *b*  $\Rightarrow$  *O\_witness* *n* (*next* *n* *b*)

end.

Definition inv\_before\_witness :

```

  ∀ n, before_witness n → ~ (P n) → before_witness (S n) :=
  fun n b =>
    match b return ¬ P n → before_witness (S n) with
    | stop _ p => fun not_p => match (not_p p) with end
    | next _ b => fun _ => b
    end.

```

Fixpoint linear\_search m (b : before\_witness m) : {n : nat | P n} :=

```

  match P_dec m with
  | left yes => exist (fun n => P n) m yes
  | right no => linear_search (S m) (inv_before_witness m b no)
  end.

```

Definition constructive\_indefinite\_ground\_description\_nat :

```

End ConstructiveIndefiniteGroundDescription\_Direct.

Require Import Arith.

Section ConstructiveIndefiniteGroundDescription\_Acc.

Variable P : nat → Prop.

Hypothesis P\_decidable : ∀ n : nat, {P n} + {¬ P n}.

The predicate *Acc* delineates elements that are accessible via a given relation *R*. An element is accessible if there are no infinite *R*-descending chains starting from it.

To use *Fix\_F*, we define a relation *R* and prove that if  $\exists n, P n$  then 0 is accessible with respect to *R*. Then, by induction on the definition of *Acc R* 0, we show  $\{n : nat \mid P n\}$ .

The relation *R* describes the connection between the two successive numbers we try. Namely, *y* is *R*-less than *x* if we try *y* after *x*, i.e.,  $y = S x$  and *P x* is false. Then the absence of an infinite *R*-descending chain from 0 is equivalent to the termination of our searching algorithm.

Let  $R (x y : nat) : Prop := x = S y \wedge \neg P y$ .

# Library `Coq.Logic.Decidable`

Properties of decidable propositions

**Definition** `decidable` ( $P:\text{Prop}$ ) :=  $P \vee \neg P$ .

**Theorem** `dec_not_not` :  $\forall P:\text{Prop}, \text{decidable } P \rightarrow (\neg P \rightarrow \text{False}) \rightarrow P$ .

**Theorem** `dec_True` : `decidable True`.

**Theorem** `dec_False` : `decidable False`.

**Theorem** `dec_or` :

$\forall A B:\text{Prop}, \text{decidable } A \rightarrow \text{decidable } B \rightarrow \text{decidable } (A \vee B)$ .

**Theorem** `dec_and` :

$\forall A B:\text{Prop}, \text{decidable } A \rightarrow \text{decidable } B \rightarrow \text{decidable } (A \wedge B)$ .

**Theorem** `dec_not` :  $\forall A:\text{Prop}, \text{decidable } A \rightarrow \text{decidable } (\neg A)$ .

**Theorem** `dec_imp` :

$\forall A B:\text{Prop}, \text{decidable } A \rightarrow \text{decidable } B \rightarrow \text{decidable } (A \rightarrow B)$ .

**Theorem** `dec_iff` :

$\forall A B:\text{Prop}, \text{decidable } A \rightarrow \text{decidable } B \rightarrow \text{decidable } (A \leftrightarrow B)$ .

**Theorem** `not_not` :  $\forall P:\text{Prop}, \text{decidable } P \rightarrow \neg \neg P \rightarrow P$ .

**Theorem** `not_or` :  $\forall A B:\text{Prop}, \neg (A \vee B) \rightarrow \neg A \wedge \neg B$ .

**Theorem** `not_and` :  $\forall A B:\text{Prop}, \text{decidable } A \rightarrow \neg (A \wedge B) \rightarrow \neg A \vee \neg B$ .

**Theorem** `not_imp` :  $\forall A B:\text{Prop}, \text{decidable } A \rightarrow \neg (A \rightarrow B) \rightarrow A \wedge \neg B$ .

**Theorem** `imp_simp` :  $\forall A B:\text{Prop}, \text{decidable } A \rightarrow (A \rightarrow B) \rightarrow \neg A \vee B$ .

**Theorem** `not_iff` :

$\forall A B:\text{Prop}, \text{decidable } A \rightarrow \text{decidable } B \rightarrow$   
 $\neg (A \leftrightarrow B) \rightarrow (A \wedge \neg B) \vee (\neg A \wedge B)$ .

Results formulated with `iff`, used in `FSetDecide`. Negation are expanded since it is unclear whether setoid rewrite will always perform conversion.

We begin with lemmas that, when read from left to right, can be understood as ways to eliminate uses of *not*.

**Theorem** `not_true_iff` :  $(\text{True} \rightarrow \text{False}) \leftrightarrow \text{False}$ .

```

Theorem not_false_iff : (False → False) ↔ True.
Theorem not_not_iff : ∀ A:Prop, decidable A →
  (((A → False) → False) ↔ A).
Theorem contrapositive : ∀ A B:Prop, decidable A →
  (((A → False) → (B → False)) ↔ (B → A)).
Lemma or_not_l_iff_1 : ∀ A B: Prop, decidable A →
  ((A → False) ∨ B ↔ (A → B)).
Lemma or_not_l_iff_2 : ∀ A B: Prop, decidable B →
  ((A → False) ∨ B ↔ (A → B)).
Lemma or_not_r_iff_1 : ∀ A B: Prop, decidable A →
  (A ∨ (B → False) ↔ (B → A)).
Lemma or_not_r_iff_2 : ∀ A B: Prop, decidable B →
  (A ∨ (B → False) ↔ (B → A)).
Lemma imp_not_l : ∀ A B: Prop, decidable A →
  (((A → False) → B) ↔ (A ∨ B)).

```

Moving Negations Around: We have four lemmas that, when read from left to right, describe how to push negations toward the leaves of a proposition and, when read from right to left, describe how to pull negations toward the top of a proposition.

```

Theorem not_or_iff : ∀ A B:Prop,
  (A ∨ B → False) ↔ (A → False) ∧ (B → False).
Lemma not_and_iff : ∀ A B:Prop,
  (A ∧ B → False) ↔ (A → B → False).
Lemma not_imp_iff : ∀ A B:Prop, decidable A →
  (((A → B) → False) ↔ A ∧ (B → False)).
Lemma not_imp_rev_iff : ∀ A B : Prop, decidable A →
  (((A → B) → False) ↔ (B → False) ∧ A).

```

```

Theorem dec_functional_relation :
  ∀ (X Y : Type) (A:X→Y→Prop), (∀ y y' : Y, decidable (y=y')) →
  (∀ x, ∃! y, A x y) → ∀ x y, decidable (A x y).

```

With the following hint database, we can leverage `auto` to check decidability of propositions.

```

Hint Resolve dec_True dec_False dec_or dec_and dec_imp dec_not dec_iff
: decidable_prop.

```

`solve_decidable using lib` will solve goals about the decidability of a proposition, assisted by an auxiliary database of lemmas. The database is intended to contain lemmas stating the decidability of base propositions, (e.g., the decidability of equality on a particular inductive type).

```

Tactic Notation "solve_decidable" "using" ident(db) :=
  match goal with
  | ⊢ decidable _ =>
    solve [ auto 100 with decidable_prop db ]
  end.

```

```
Tactic Notation "solve_decidable" :=  
  solve_decidable using core.
```

## Chapter 23

# Library **Coq.Logic.Description**

This file provides a constructive form of definite description; it allows building functions from the proof of their existence in any context; this is weaker than Church's iota operator

```
Require Import ChoiceFacts.
```

```
Set Implicit Arguments.
```

```
Axiom constructive_definite_description :

     $(\exists! x, P x) \rightarrow \{ x : A \mid P x \}.$ 
```

## Chapter 24

# Library **Coq.Logic.Diaconescu**

Diaconescu showed that the Axiom of Choice entails Excluded-Middle in topoi [Diaconescu75](#). Lacas and Werner adapted the proof to show that the axiom of choice in equivalence classes entails Excluded-Middle in Type Theory [LacasWerner99](#).

Three variants of Diaconescu's result in type theory are shown below.

A. A proof that the relational form of the Axiom of Choice + Extensionality for Predicates entails Excluded-Middle (by Hugo Herbelin)

B. A proof that the relational form of the Axiom of Choice + Proof Irrelevance entails Excluded-Middle for Equality Statements (by Benjamin Werner)

C. A proof that extensional Hilbert epsilon's description operator entails excluded-middle (taken from Bell [Bell93](#))

See also [Carlström](#) for a discussion of the connection between the Extensional Axiom of Choice and Excluded-Middle

[Diaconescu75](#) Radu Diaconescu, Axiom of Choice and Complementation, in Proceedings of AMS, vol 51, pp 176-178, 1975.

[LacasWerner99](#) Samuel Lacas, Benjamin Werner, Which Choices imply the excluded middle?, preprint, 1999.

[Bell93](#) John L. Bell, Hilbert's epsilon operator and classical logic, Journal of Philosophical Logic, 22: 1-18, 1993

[Carlström04](#) Jesper Carlström, EM + Ext + AC\_int <-> AC\_ext, Mathematical Logic Quarterly, vol 50(3), pp 236-240, 2004.

### 24.1 Pred. Ext. + Rel. Axiom of Choice -> Excluded-Middle

**Section** `PredExt_RelChoice_imp_EM`.

The axiom of extensionality for predicates

**Definition** `PredicateExtensionality` :=

$\forall P Q:\text{bool} \rightarrow \text{Prop}, (\forall b:\text{bool}, P\ b \leftrightarrow Q\ b) \rightarrow P = Q.$

From predicate extensionality we get propositional extensionality hence proof-irrelevance

**Require Import** `ClassicalFacts`.

**Variable** `pred_extensionality` : `PredicateExtensionality`.

Lemma prop\_ext :  $\forall A B:\text{Prop}, (A \leftrightarrow B) \rightarrow A = B$ .

Lemma proof\_irrel :  $\forall (A:\text{Prop}) (a1\ a2:A), a1 = a2$ .

From proof-irrelevance and relational choice, we get guarded relational choice

Require Import ChoiceFacts.

Variable rel\_choice : RelationalChoice.

Lemma guarded\_rel\_choice : GuardedRelationalChoice.

The form of choice we need: there is a functional relation which chooses an element in any non empty subset of bool

Require Import Bool.

Lemma AC\_bool\_subset\_to\_bool :

$\exists R : (\text{bool} \rightarrow \text{Prop}) \rightarrow \text{bool} \rightarrow \text{Prop},$   
 $(\forall P:\text{bool} \rightarrow \text{Prop},$   
 $(\exists b : \text{bool}, P\ b) \rightarrow$   
 $\exists b : \text{bool}, P\ b \wedge R\ P\ b \wedge (\forall b':\text{bool}, R\ P\ b' \rightarrow b = b')).$

The proof of the excluded middle Remark: P could have been in Set or Type

Theorem pred\_ext\_and\_rel\_choice\_imp\_EM :  $\forall P:\text{Prop}, P \vee \neg P$ .

End PredExt\_RelChoice\_imp\_EM.

## 24.2 Proof-Irrel. + Rel. Axiom of Choice $\rightarrow$ Excl.-Middle for Equality

This is an adaptation of Diaconescu's theorem, exploiting the form of extensionality provided by proof-irrelevance

Section ProofIrrel\_RelChoice\_imp\_EqEM.

Variable rel\_choice : RelationalChoice.

Variable proof\_irrelevance :  $\forall P:\text{Prop}, \forall x\ y:P, x=y$ .

Let  $a1$  and  $a2$  be two elements in some type  $A$

Variable  $A:\text{Type}$ .

Variables  $a1\ a2 : A$ .

We build the subset  $A'$  of  $A$  made of  $a1$  and  $a2$

Definition  $A' := @sigT\ A\ (\text{fun } x \Rightarrow x=a1 \vee x=a2)$ .

Definition  $a1':A'$ .

Defined.

Definition  $a2':A'$ .

Defined.

By proof-irrelevance, projection is a retraction

Lemma projT1\_injective :  $a1=a2 \rightarrow a1'=a2'$ .

But from the actual proofs of being in  $A'$ , we can assert in the proof-irrelevant world the existence of relevant boolean witnesses

**Lemma** `decide` :  $\forall x:A', \exists y:\text{bool},$   
 $(\text{projT1 } x = a1 \wedge y = \text{true}) \vee (\text{projT1 } x = a2 \wedge y = \text{false}).$

Thanks to the axiom of choice, the boolean witnesses move from the propositional world to the relevant world

**Theorem** `proof_irrel_rel_choice_imp_eq_dec` :  $a1=a2 \vee \neg a1=a2.$

An alternative more concise proof can be done by directly using the guarded relational choice

**Lemma** `proof_irrel_rel_choice_imp_eq_dec'` :  $a1=a2 \vee \neg a1=a2.$

**End** `ProofIrrel_RelChoice_imp_EqEM`.

## 24.3 Extensional Hilbert's epsilon description operator $\rightarrow$ Excluded-Middle

Proof sketch from Bell [Bell93](#) (with thanks to P. Castéran)

**Section** `ExtensionalEpsilon_imp_EM`.

**Variable** `epsilon` :  $\forall A : \text{Type}, \text{inhabited } A \rightarrow (A \rightarrow \text{Prop}) \rightarrow A.$

**Hypothesis** `epsilon_spec` :

$\forall (A:\text{Type}) (i:\text{inhabited } A) (P:A\rightarrow\text{Prop}),$   
 $(\exists x, P x) \rightarrow P (\text{epsilon } A i P).$

**Hypothesis** `epsilon_extensionality` :

$\forall (A:\text{Type}) (i:\text{inhabited } A) (P Q:A\rightarrow\text{Prop}),$   
 $(\forall a, P a \leftrightarrow Q a) \rightarrow \text{epsilon } A i P = \text{epsilon } A i Q.$

**Theorem** `extensional_epsilon_imp_EM` :  $\forall P:\text{Prop}, P \vee \neg P.$

**End** `ExtensionalEpsilon_imp_EM`.

## Chapter 25

# Library Coq.Logic.Epsilon

This file provides indefinite description under the form of Hilbert's epsilon operator; it does not assume classical logic.

**Require Import** ChoiceFacts.

**Set Implicit Arguments.**

Hilbert's epsilon: operator and specification in one statement

**Axiom** *epsilon\_statement* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}), \text{inhabited } A \rightarrow$   
 $\{ x : A \mid (\exists x, P x) \rightarrow P x \}.$

**Lemma** *constructive\_indefinite\_description* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}),$   
 $(\exists x, P x) \rightarrow \{ x : A \mid P x \}.$

**Lemma** *small\_drinkers'\_paradox* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}), \text{inhabited } A \rightarrow$   
 $\exists x, (\exists x, P x) \rightarrow P x.$

**Theorem** *iota\_statement* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}), \text{inhabited } A \rightarrow$   
 $\{ x : A \mid (\exists! x : A, P x) \rightarrow P x \}.$

**Lemma** *constructive\_definite\_description* :

$\forall (A : \text{Type}) (P : A \rightarrow \text{Prop}),$   
 $(\exists! x, P x) \rightarrow \{ x : A \mid P x \}.$

Hilbert's epsilon operator and its specification

**Definition** *epsilon* ( $A : \text{Type}$ ) ( $i : \text{inhabited } A$ ) ( $P : A \rightarrow \text{Prop}$ ) :  $A$   
:= *proj1\_sig* (*epsilon\_statement*  $P i$ ).

**Definition** *epsilon\_spec* ( $A : \text{Type}$ ) ( $i : \text{inhabited } A$ ) ( $P : A \rightarrow \text{Prop}$ ) :

:= *proj2\_sig* (*epsilon\_statement*  $P i$ ).

Church's iota operator and its specification

**Definition** *iota* ( $A : \text{Type}$ ) ( $i : \text{inhabited } A$ ) ( $P : A \rightarrow \text{Prop}$ ) :  $A$

```

:= proj1_sig (iota_statement  $P$   $i$ ).
Definition iota_spec ( $A : \text{Type}$ ) ( $i : \text{inhabited } A$ ) ( $P : A \rightarrow \text{Prop}$ ) :
  ( $\exists ! x : A, P\ x$ )  $\rightarrow P$  (iota  $i$   $P$ )
:= proj2_sig (iota_statement  $P$   $i$ ).

```

## Chapter 26

# Library `Coq.Logic.Eqdep_dec`

We prove that there is only one proof of  $x=x$ , i.e *eq\_refl*  $x$ . This holds if the equality upon the set of  $x$  is decidable. A corollary of this theorem is the equality of the right projections of two equal dependent pairs.

Author: Thomas Kleymann |<tms@dcs.ed.ac.uk>| in Lego adapted to Coq by B. Barras

Credit: Proofs up to *K\_dec* follow an outline by Michael Hedberg

Table of contents:

1. Streicher's K and injectivity of dependent pair hold on decidable types

1.1. Definition of the functor that builds properties of dependent equalities from a proof of decidability of equality for a set in Type

1.2. Definition of the functor that builds properties of dependent equalities from a proof of decidability of equality for a set in Set

### 26.1 Streicher's K and injectivity of dependent pair hold on decidable types

**Set Implicit Arguments.**

**Section EqdepDec.**

**Variable**  $A : \text{Type}$ .

**Let**  $\text{comp} (x\ y\ y':A) (eq1:x = y) (eq2:x = y') : y = y' :=$   
 $\text{eq\_ind } \_ (\text{fun } a \Rightarrow a = y') eq2 \_ eq1.$

**Remark**  $\text{trans\_sym\_eq} : \forall (x\ y:A) (u:x = y), \text{comp } u\ u = \text{eq\_refl } y.$

**Variable**  $x : A.$

**Variable**  $\text{eq\_dec} : \forall y:A, x = y \vee x \neq y.$

**Let**  $\text{nu} (y:A) (u:x = y) : x = y :=$   
 $\text{match } \text{eq\_dec } y \text{ with}$   
 $\quad | \text{or\_introl } eqxy \Rightarrow eqxy$   
 $\quad | \text{or\_intror } neqxy \Rightarrow \text{False\_ind } \_ (neqxy\ u)$   
**end.**

Let  $nu\_constant : \forall (y:A) (u\ v:x = y), nu\ u = nu\ v$ .

Qed.

Let  $nu\_inv (y:A) (v:x = y) : x = y := comp\ (nu\ (eq\_refl\ x))\ v$ .

Remark  $nu\_left\_inv\_on : \forall (y:A) (u:x = y), nu\_inv\ (nu\ u) = u$ .

Theorem  $eq\_proofs\_unicity\_on : \forall (y:A) (p1\ p2:x = y), p1 = p2$ .

Theorem  $K\_dec\_on :$

$\forall P:x = x \rightarrow Prop, P\ (eq\_refl\ x) \rightarrow \forall p:x = x, P\ p$ .

The corollary

Let  $proj (P:A \rightarrow Prop) (exP:ex\ P) (def:P\ x) : P\ x :=$

```
match exP with
| ex_intro _ x' prf =>
  match eq_dec x' with
  | or_introl eqprf => eq_ind x' P prf x (eq_sym eqprf)
  | _ => def
end
end.
```

Theorem  $inj\_right\_pair\_on :$

$\forall (P:A \rightarrow Prop) (y\ y':P\ x),$   
 $ex\_intro\ P\ x\ y = ex\_intro\ P\ x\ y' \rightarrow y = y'.$

End EqdepDec.

Now we prove the versions that require decidable equality for the entire type rather than just on the given element. The rest of the file uses this total decidable equality. We could do everything using decidable equality at a point (because the induction rule for  $eq$  is really an induction rule for  $\{ y : A \mid x = y \}$ ), but we don't currently, because changing everything would break backward compatibility and no-one has yet taken the time to define the pointed versions, and then re-define the non-pointed versions in terms of those.

Theorem  $eq\_proofs\_unicity\ A\ (eq\_dec : \forall x\ y : A, x = y \vee x \neq y) (x : A)$   
 $: \forall (y:A) (p1\ p2:x = y), p1 = p2.$

Theorem  $K\_dec\ A\ (eq\_dec : \forall x\ y : A, x = y \vee x \neq y) (x : A)$   
 $: \forall P:x = x \rightarrow Prop, P\ (eq\_refl\ x) \rightarrow \forall p:x = x, P\ p.$

Theorem  $inj\_right\_pair\ A\ (eq\_dec : \forall x\ y : A, x = y \vee x \neq y) (x : A)$   
 $: \forall (P:A \rightarrow Prop) (y\ y':P\ x),$   
 $ex\_intro\ P\ x\ y = ex\_intro\ P\ x\ y' \rightarrow y = y'.$

Require Import EqdepFacts.

We deduce axiom  $K$  for (decidable) types  $Theorem\ K\_dec\_type :$

$\forall A:Type,$   
 $(\forall x\ y:A, \{x = y\} + \{x \neq y\}) \rightarrow$   
 $\forall (x:A) (P:x = x \rightarrow Prop), P\ (eq\_refl\ x) \rightarrow \forall p:x = x, P\ p.$

Theorem  $K\_dec\_set :$

$\forall A:Set,$   
 $(\forall x\ y:A, \{x = y\} + \{x \neq y\}) \rightarrow$

$\forall (x:A) (P:x = x \rightarrow \text{Prop}), P (\text{eq\_refl } x) \rightarrow \forall p:x = x, P p.$

We deduce the *eq\_rect\_eq* axiom for (decidable) types **Theorem** *eq\_rect\_eq\_dec* :

$\forall A:\text{Type},$   
 $(\forall x y:A, \{x = y\} + \{x \neq y\}) \rightarrow$   
 $\forall (p:A) (Q:A \rightarrow \text{Type}) (x:Q p) (h:p = p), x = \text{eq\_rect } p Q x p h.$

We deduce the injectivity of dependent equality for decidable types **Theorem** *eq\_dep\_eq\_dec* :

$\forall A:\text{Type},$   
 $(\forall x y:A, \{x = y\} + \{x \neq y\}) \rightarrow$   
 $\forall (P:A \rightarrow \text{Type}) (p:A) (x y:P p), \text{eq\_dep } A P p x p y \rightarrow x = y.$

**Theorem** *UIP\_dec* :

$\forall (A:\text{Type}),$   
 $(\forall x y:A, \{x = y\} + \{x \neq y\}) \rightarrow$   
 $\forall (x y:A) (p1 p2:x = y), p1 = p2.$

 $\text{existT } P\ p\ x = \text{existT } P\ p\ y \rightarrow x = y.$

Proof-irrelevance on subsets of decidable sets

**Lemma** `inj_pairP2` :  
 $\forall (P:U \rightarrow \text{Prop}) (x:U) (p\ q:P\ x),$   
 $\text{ex\_intro } P\ x\ p = \text{ex\_intro } P\ x\ q \rightarrow p = q.$

**End** `DECIDABLEEQDEP`.

### 26.1.2 Definition of the functor that builds properties of dependent equalities on decidable sets in `Set`

The signature of decidable sets in `Set`

**Module** `Type` `DECIDABLESET`.

**Parameter** `U:Set`.  
**Axiom** `eq_dec` :  $\forall x\ y:U, \{x = y\} + \{x \neq y\}.$

**End** `DECIDABLESET`.

The module *DecidableEqDepSet* collects equality properties for decidable set in `Set`

**Module** `DECIDABLEEQDEPSET` (`M:DECIDABLESET`).

**Import** `M`.  
**Module** `N:=DECIDABLEEQDEP(M)`.

Invariance by Substitution of Reflexive Equality Proofs

**Lemma** `eq_rect_eq` :  
 $\forall (p:U) (Q:U \rightarrow \text{Type}) (x:Q\ p) (h:p = p), x = \text{eq\_rect } p\ Q\ x\ p\ h.$

Injectivity of Dependent Equality

**Theorem** `eq_dep_eq` :  
 $\forall (P:U \rightarrow \text{Type}) (p:U) (x\ y:P\ p), \text{eq\_dep } U\ P\ p\ x\ p\ y \rightarrow x = y.$

Uniqueness of Identity Proofs (UIP)

**Lemma** `UIP` :  $\forall (x\ y:U) (p1\ p2:x = y), p1 = p2.$

Uniqueness of Reflexive Identity Proofs

**Lemma** `UIP_refl` :  $\forall (x:U) (p:x = x), p = \text{eq\_refl } x.$

Streicher's axiom K

**Lemma** `Streicher_K` :  
 $\forall (x:U) (P:x = x \rightarrow \text{Prop}), P (\text{eq\_refl } x) \rightarrow \forall p:x = x, P\ p.$

Proof-irrelevance on subsets of decidable sets

**Lemma** `inj_pairP2` :  
 $\forall (P:U \rightarrow \text{Prop}) (x:U) (p\ q:P\ x),$   
 $\text{ex\_intro } P\ x\ p = \text{ex\_intro } P\ x\ q \rightarrow p = q.$

Injectivity of equality on dependent pairs in `Type`

Lemma inj\_pair2 :

$\forall (P:U \rightarrow \text{Type}) (p:U) (x\ y:P\ p),$   
 $\text{existT } P\ p\ x = \text{existT } P\ p\ y \rightarrow x = y.$

Injectivity of equality on dependent pairs with second component in **Type**

Notation inj\_pairT2 := inj\_pair2.

End DECIDABLEEQDEPSET.

From decidability to inj\_pair2 Lemma inj\_pair2\_eq\_dec :  $\forall A:\text{Type}, (\forall x\ y:A, \{x=y\}+\{x\neq y\})$   
 $\rightarrow$

$(\forall (P:A \rightarrow \text{Type}) (p:A) (x\ y:P\ p), \text{existT } P\ p\ x = \text{existT } P\ p\ y \rightarrow x = y).$

Examples of short direct proofs of unicity of reflexivity proofs on specific domains

Lemma UIP\_refl\_unit ( $x : \text{tt} = \text{tt}$ ) :  $x = \text{eq\_refl tt}.$

Lemma UIP\_refl\_bool ( $b:\text{bool}$ ) ( $x : b = b$ ) :  $x = \text{eq\_refl}.$

Lemma UIP\_refl\_nat ( $n:\text{nat}$ ) ( $x : n = n$ ) :  $x = \text{eq\_refl}.$

## Chapter 27

# Library **Coq.Logic.EqdepFacts**

This file defines dependent equality and shows its equivalence with equality on dependent pairs (inhabiting sigma-types). It derives the consequence of axiomatizing the invariance by substitution of reflexive equality proofs and shows the equivalence between the 4 following statements

- Invariance by Substitution of Reflexive Equality Proofs.
- Injectivity of Dependent Equality
- Uniqueness of Identity Proofs
- Uniqueness of Reflexive Identity Proofs
- Streicher's Axiom K

These statements are independent of the calculus of constructions 2.

$\text{Eq\_rect\_eq\_on } p P x \rightarrow \text{Eq\_dep\_eq\_on } P p x.$

**Lemma** `eq_rect_eq__eq_dep_eq` :  $\text{Eq\_rect\_eq} \rightarrow \text{Eq\_dep\_eq}.$

Uniqueness of Identity Proofs (UIP) is a consequence of Injectivity of Dependent Equality

**Lemma** `eq_dep_eq_on__UIP_on` ( $x y : U$ ) ( $p1 : x = y$ ) :

$\text{Eq\_dep\_eq\_on } (\text{fun } y \Rightarrow x = y) x \text{eq\_refl} \rightarrow \text{UIP\_on\_ } x y p1.$

**Lemma** `eq_dep_eq__UIP` :  $\text{Eq\_dep\_eq} \rightarrow \text{UIP\_}.$

Uniqueness of Reflexive Identity Proofs is a direct instance of UIP

**Lemma** `UIP_on__UIP_refl_on` ( $x : U$ ) :

$\text{UIP\_on\_ } x x \text{eq\_refl} \rightarrow \text{UIP\_refl\_on\_ } x.$

**Lemma** `UIP__UIP_refl` :  $\text{UIP\_} \rightarrow \text{UIP\_refl\_}.$

Streicher's axiom K is a direct consequence of Uniqueness of Reflexive Identity Proofs

**Lemma** `UIP_refl_on__Streicher_K_on` ( $x : U$ ) ( $P : x = x \rightarrow \text{Prop}$ ) :

$\text{UIP\_refl\_on\_ } x \rightarrow \text{Streicher\_K\_on\_ } x P.$

**Lemma** `UIP_refl__Streicher_K` :  $\text{UIP\_refl\_} \rightarrow \text{Streicher\_K\_}.$

We finally recover from K the Invariance by Substitution of Reflexive Equality Proofs

**Lemma** `Streicher_K_on__eq_rect_eq_on` ( $p : U$ ) ( $P : U \rightarrow \text{Type}$ ) ( $x : P p$ ) :

$\text{Streicher\_K\_on\_ } p (\text{fun } h \Rightarrow x = \text{rew} \rightarrow [P] h \text{ in } x)$

$\rightarrow \text{Eq\_rect\_eq\_on } p P x.$

**Lemma** `Streicher_K__eq_rect_eq` :  $\text{Streicher\_K\_} \rightarrow \text{Eq\_rect\_eq}.$

Remark: It is reasonable to think that `eq_rect_eq` is strictly stronger than `eq_rec_eq` (which is `eq_rect_eq` restricted on `Set`):

**Definition** `Eq_rec_eq` :=  $\forall (P : U \rightarrow \text{Set}) (p : U) (x : P p) (h : p = p), x = \text{eq\_rec } p P x p h.$

Typically, `eq_rect_eq` allows proving UIP and Streicher's K what does not seem possible with `eq_rec_eq`. In particular, the proof of `UIP` requires to use `eq_rect_eq` on `fun y → x=y` which is in `Type` but not in `Set`.

**End** Equivalences.

UIP\_refl is downward closed (a short proof of the key lemma of Voevodsky's proof of inclusion of h-level n into h-level n+1; see hlevelIntosn in <https://github.com/vladimirias/Foundations.git>).

**Theorem** UIP\_shift\_on  $(X : \text{Type}) (x : X) :$

UIP\_refl\_on\_  $X \ x \rightarrow \forall y : x = x, \text{UIP\_refl\_on\_} (x = x) \ y.$

**Theorem** UIP\_shift :  $\forall U, \text{UIP\_refl\_} U \rightarrow \forall x:U, \text{UIP\_refl\_} (x = x).$

**Section** Corollaries.

**Variable**  $U:\text{Type}.$

UIP implies the injectivity of equality on dependent pairs in Type

**Definition** Inj\_dep\_pair\_on  $(P : U \rightarrow \text{Type}) (p : U) (x : P \ p) :=$

$\forall (y : P \ p), \text{existT } P \ p \ x = \text{existT } P \ p \ y \rightarrow x = y.$

**Definition** Inj\_dep\_pair :=  $\forall P \ p \ x, \text{Inj\_dep\_pair\_on } P \ p \ x.$

**Lemma** eq\_dep\_eq\_on\_inj\_pair2\_on  $(P : U \rightarrow \text{Type}) (p : U) (x : P \ p) :$

$\text{Eq\_dep\_eq\_on } U \ P \ p \ x \rightarrow \text{Inj\_dep\_pair\_on } P \ p \ x.$

**Lemma** eq\_dep\_eq\_inj\_pair2 :  $\text{Eq\_dep\_eq } U \rightarrow \text{Inj\_dep\_pair}.$

**End** Corollaries.

**Notation** Inj\_dep\_pairS := Inj\_dep\_pair.

**Notation** Inj\_dep\_pairT := Inj\_dep\_pair.

**Notation** eq\_dep\_eq\_inj\_pairT2 := eq\_dep\_eq\_inj\_pair2.

## 27.3 Definition of the functor that builds properties of dependent equalities assuming axiom eq\_rect\_eq

**Module** Type EQDEPELIMINATION.

**Axiom** eq\_rect\_eq :

$\forall (U:\text{Type}) (p:U) (Q:U \rightarrow \text{Type}) (x:Q \ p) (h:p = p),$   
 $x = \text{eq\_rect } p \ Q \ x \ p \ h.$

**End** EQDEPELIMINATION.

**Module** EQDEPTHEORY  $(M:\text{EQDEPELIMINATION}).$

**Section** Axioms.

**Variable**  $U:\text{Type}.$

Invariance by Substitution of Reflexive Equality Proofs

**Lemma** eq\_rect\_eq :

$\forall (p:U) (Q:U \rightarrow \text{Type}) (x:Q \ p) (h:p = p), x = \text{eq\_rect } p \ Q \ x \ p \ h.$

**Lemma** eq\_rec\_eq :

$\forall (p:U) (Q:U \rightarrow \text{Set}) (x:Q \ p) (h:p = p), x = \text{eq\_rec } p \ Q \ x \ p \ h.$

Injectivity of Dependent Equality

**Lemma** eq\_dep\_eq :  $\forall (P:U \rightarrow \text{Type}) (p:U) (x \ y:P \ p), \text{eq\_dep } p \ x \ p \ y \rightarrow x = y.$

Uniqueness of Identity Proofs (UIP) is a consequence of Injectivity of Dependent Equality

**Lemma** `UIP` :  $\forall (x\ y:U) (p1\ p2:x = y), p1 = p2$ .

Uniqueness of Reflexive Identity Proofs is a direct instance of UIP

**Lemma** `UIP_refl` :  $\forall (x:U) (p:x = x), p = \text{eq\_refl } x$ .

Streicher's axiom K is a direct consequence of Uniqueness of Reflexive Identity Proofs

**Lemma** `Streicher_K` :

$\forall (x:U) (P:x = x \rightarrow \text{Prop}), P (\text{eq\_refl } x) \rightarrow \forall p:x = x, P\ p$ .

**End** `Axioms`.

UIP implies the injectivity of equality on dependent pairs in Type

**Lemma** `inj_pair2` :

$\forall (U:\text{Type}) (P:U \rightarrow \text{Type}) (p:U) (x\ y:P\ p),$   
 $\text{existT } P\ p\ x = \text{existT } P\ p\ y \rightarrow x = y$ .

**Notation** `inj_pairT2` := `inj_pair2`.

**End** `EQDEPTHEORY`.

Basic facts about eq\_dep

**Lemma** `f_eq_dep` :

$\forall U (P:U \rightarrow \text{Type}) R\ p\ q\ x\ y (f:\forall p, P\ p \rightarrow R\ p),$   
 $\text{eq\_dep } p\ x\ q\ y \rightarrow \text{eq\_dep } p\ (f\ p\ x)\ q\ (f\ q\ y)$ .

**Lemma** `eq_dep_non_dep` :

$\forall U\ P\ p\ q\ x\ y, @ \text{eq\_dep } U\ (\text{fun } _ \Rightarrow P)\ p\ x\ q\ y \rightarrow x = y$ .

**Lemma** `f_eq_dep_non_dep` :

$\forall U (P:U \rightarrow \text{Type}) R\ p\ q\ x\ y (f:\forall p, P\ p \rightarrow R),$   
 $\text{eq\_dep } p\ x\ q\ y \rightarrow f\ p\ x = f\ q\ y$ .

## Chapter 28

# Library **Coq.Logic.Eqdep**

This file axiomatizes the invariance by substitution of reflexive equality proofs [Streicher93] and exports its consequences, such as the injectivity of the projection of the dependent pair.

Theorem WeakFanTheorem :  $\forall\ P, \text{barred } P \rightarrow \text{inductively\_barred } P\ []$ .

```

## Chapter 30

# Library Coq.Logic.WKL

A constructive proof of a version of Weak König's Lemma over a decidable predicate in the formulation of which infinite paths are treated as predicates. The representation of paths as relations avoid the need for classical logic and unique choice. The decidability condition is sufficient to ensure that some required instance of double negation for disjunction of finite paths holds.

The idea of the proof comes from the proof of the weak König's lemma from separation in second-order arithmetic.

Notice that we do not start from a tree but just from an arbitrary predicate. Original Weak König's Lemma is the instantiation of the lemma to a tree

**Require Import** WeakFan List.

**Import** ListNotations.

**Require Import** Omega.

*is\_path\_from*  $P\ n\ l$  means that there exists a path of length  $n$  from  $l$  on which  $P$  does not hold

**Inductive** *is\_path\_from* ( $P$ :list bool  $\rightarrow$  Prop) : nat  $\rightarrow$  list bool  $\rightarrow$  Prop :=  
| **here**  $l$  :  $\neg P\ l \rightarrow$  *is\_path\_from*  $P\ 0\ l$   
| **next\_left**  $l\ n$  :  $\neg P\ l \rightarrow$  *is\_path\_from*  $P\ n\ (\text{true}::l) \rightarrow$  *is\_path\_from*  $P\ (S\ n)\ l$   
| **next\_right**  $l\ n$  :  $\neg P\ l \rightarrow$  *is\_path\_from*  $P\ n\ (\text{false}::l) \rightarrow$  *is\_path\_from*  $P\ (S\ n)\ l$ .

We give the characterization of *is\_path\_from* in terms of a more common arithmetical formula

**Proposition** *is\_path\_from\_characterization*  $P\ n\ l$  :

*is\_path\_from*  $P\ n\ l \leftrightarrow \exists\ l', \text{length } l' = n \wedge \forall\ n', n' \leq n \rightarrow \neg P\ (\text{rev } (\text{firstn } n'\ l') ++ l).$

*infinite\_from*  $P\ l$  means that we can find arbitrary long paths along which  $P$  does not hold above  $l$

**Definition** *infinite\_from* ( $P$ :list bool  $\rightarrow$  Prop)  $l$  :=  $\forall\ n, \text{is\_path\_from } P\ n\ l$ .

*has\_infinite\_path*  $P$  means that there is an infinite path (represented as a predicate) along which  $P$  does not hold at all

**Definition** *has\_infinite\_path* ( $P$ :list bool  $\rightarrow$  Prop) :=

$\exists\ (X:\text{nat} \rightarrow \text{Prop}), \forall\ l, \text{approx } X\ l \rightarrow \neg P\ l$ .

*inductively\_barred\_at*  $P\ n\ l$  means that  $P$  eventually holds above  $l$  after at most  $n$  steps upwards

### Library

## Coq.Logic.FunctionalExtensionality

This module states the axiom of (dependent) functional extensionality and (dependent) eta-expansion. It introduces a tactic **extensionality** to apply the axiom of extensionality to an equality goal.

The converse of functional extensionality.

**Lemma** `equal_f` :  $\forall \{A\ B : \text{Type}\} \{f\ g : A \rightarrow B\},$   
 $f = g \rightarrow \forall x, f\ x = g\ x.$

**Lemma** `equal_f_dep` :  $\forall \{A\ B\} \{f\ g : \forall (x : A), B\ x\},$   
 $f = g \rightarrow \forall x, f\ x = g\ x.$

Statements of functional extensionality for simple and dependent functions.

**Axiom** `functional_extensionality_dep` :  $\forall \{A\} \{B : A \rightarrow \text{Type}\},$   
 $\forall (f\ g : \forall x : A, B\ x),$   
 $(\forall x, f\ x = g\ x) \rightarrow f = g.$

**Lemma** `functional_extensionality`  $\{A\ B\} (f\ g : A \rightarrow B) :$   
 $(\forall x, f\ x = g\ x) \rightarrow f = g.$

Extensionality of  $\forall$ s follows from functional extensionality. **Lemma** `forall_extensionality`  $\{A\} \{B$   
 $C : A \rightarrow \text{Type}\} (H : \forall x : A, B\ x = C\ x)$   
 $: (\forall x, B\ x) = (\forall x, C\ x).$

**Lemma** `forall_extensionalityP`  $\{A\} \{B\ C : A \rightarrow \text{Prop}\} (H : \forall x : A, B\ x = C\ x)$   
 $: (\forall x, B\ x) = (\forall x, C\ x).$

**Lemma** `forall_extensionalityS`  $\{A\} \{B\ C : A \rightarrow \text{Set}\} (H : \forall x : A, B\ x = C\ x)$   
 $: (\forall x, B\ x) = (\forall x, C\ x).$

Apply `functional_extensionality`, introducing variable `x`.

**Tactic Notation** "extensionality" *ident*(`x`) :=  
`match goal with`  
  `[  $\vdash ?X = ?Y$  ] =>`  
  `(apply (@functional_extensionality _ _ X Y) ||`  
    `apply (@functional_extensionality_dep _ _ X Y) ||`  
    `apply forall_extensionalityP ||`

```

    apply forall_extensionalityS ||
    apply forall_extensionality) ; intro  $x$ 
end.

```

Eta expansion follows from extensionality.

**Lemma** `eta_expansion_dep`  $\{A\} \{B : A \rightarrow \text{Type}\} (f : \forall x : A, B\ x) :$   
 $f = \text{fun } x \Rightarrow f\ x.$

**Lemma** `eta_expansion`  $\{A\ B\} (f : A \rightarrow B) : f = \text{fun } x \Rightarrow f\ x.$

## Chapter 32

# Library `Coq.Logic.ExtensionalityFacts`

Some facts and definitions about extensionality

We investigate the relations between the following extensionality principles

- Functional extensionality
- Equality of projections from diagonal
- Unicity of inverse bijections
- Bijectivity of bijective composition

Table of contents

1. Definitions
2. Functional extensionality  $\leftrightarrow$  Equality of projections from diagonal
3. Functional extensionality  $\leftrightarrow$  Unicity of inverse bijections
4. Functional extensionality  $\leftrightarrow$  Bijectivity of bijective composition

`Set Implicit Arguments.`

### 32.1 Definitions

Being an inverse

**Definition** `is_inverse`  $A\ B\ f\ g := (\forall a:A, g\ (f\ a) = a) \wedge (\forall b:B, f\ (g\ b) = b)$ .

The diagonal over A and the one-one correspondence with A

**Record** `Delta`  $A := \{ \text{pi1}:A; \text{pi2}:A; \text{eq}:\text{pi1}=\text{pi2} \}$ .

**Definition** `delta`  $\{A\}\ (a:A) := \{ | \text{pi1} := a; \text{pi2} := a; \text{eq} := \text{eq\_refl}\ a \}$ .

**Lemma** `diagonal_projs_same_behavior` :  $\forall A\ (x:\text{Delta}\ A), \text{pi1}\ x = \text{pi2}\ x$ .

**Lemma** `diagonal_inverse1` :  $\forall A, \text{is\_inverse}\ (A:=A)\ \text{delta}\ \text{pi1}$ .

**Lemma** `diagonal_inverse2` :  $\forall A, \text{is\_inverse}\ (A:=A)\ \text{delta}\ \text{pi2}$ .

Functional extensionality

Equality of projections from diagonal

Unicity of bijection inverse

Bijectivity of bijective composition

**Definition** `action A B C (f:A→B) := (fun h:B→C => fun x => h (f x)).`

## Chapter 33

# Library `Coq.Logic.Hurkens`

Exploiting Hurkens’s paradox [Hurkens95] for system U- so as to derive various contradictory contexts.

The file is divided into various sub-modules which all follow the same structure: a section introduces the contradictory hypotheses and a theorem named *paradox* concludes the module with a proof of *False*.

- The *Generic* module contains the actual Hurkens’s paradox for a postulated shallow encoding of system U- in Coq. This is an adaptation by Arnaud Spiwack of a previous, more restricted implementation by Herman Geuvers. It is used to derive every other special cases of the paradox in this file.
- The *NoRetractToImpredicativeUniverse* module contains a simple and effective formulation by Herman Geuvers [Geuvers01] of a result by Thierry Coquand [Coquand90]. It states that no impredicative sort can contain a type of which it is a retract. This result implies that Coq with classical logic stated in impredicative Set is inconsistent and that classical logic stated in Prop implies proof-irrelevance (see *ClassicalFacts.v*)
- The *NoRetractFromSmallPropositionToProp* module is a specialisation of the *NoRetractToImpredicativeUniverse* module to the case where the impredicative sort is **Prop**.
- The *NoRetractToModalProposition* module is a strengthening of the *NoRetractFromSmallPropositionToProp* module. It shows that given a monadic modality (aka closure operator)  $M$ , the type of modal propositions (i.e. such that  $M A \rightarrow A$ ) cannot be a retract of a modal proposition. It is an example of use of the paradox where the universes of system U- are not mapped to universes of Coq.
- The *NoRetractToNegativeProp* module is the specialisation of the *NoRetractFromSmallPropositionToProp* module where the modality is double-negation. This result implies that the principle of weak excluded middle ( $\forall A, \sim\sim A \vee \sim A$ ) implies a weak variant of proof irrelevance.
- The *NoRetractFromTypeToProp* module proves that **Prop** cannot be a retract of a larger type.
- The *TypeNeqSmallType* module proves that **Type** is different from any smaller type.

- The *PropNeqType* module proves that **Prop** is different from any larger **Type**. It is an instance of the previous result.

### 33.1 A modular proof of Hurkens’s paradox.

It relies on an axiomatisation of a shallow embedding of system U- (i.e. types of U- are interpreted by types of Coq). The universes are encoded in a style, due to Martin-Löf, where they are given by a set of names and a family *El*:*Name*→**Type** which interprets each name into a type. This allows the encoding of universe to be decoupled from Coq’s universes. Dependent products and abstractions are similarly postulated rather than encoded as Coq’s dependent products and abstractions.

**Module** *GENERIC*.

**Section** *Paradox*.

#### 33.1.1 Axiomatisation of impredicative universes in a Martin-Löf style

System U- has two impredicative universes. In the proof of the paradox they are slightly asymmetric (in particular the reduction rules of the small universe are not needed). Therefore, the axioms are duplicated allowing for a weaker requirement than the actual system U-.

**Large universe**

**Variable** *U1* : **Type**.

The paradox tactic can be called as a shortcut to use the paradox.  $Ltac\ paradox\ h :=$ 
 $unshelve\ (\text{refine}\ ((\text{fun } h \Rightarrow -) (\text{paradox } \text{-----})))$ .

End GENERIC.

```

## 33.2 Impredicative universes are not retracts.

There can be no retract to an impredicative Coq universe from a smaller type. In this version of the proof, the impredicativity of the universe is postulated with a pair of functions from the universe to its type and back which commute with dependent product in an appropriate way.

Module NORETRACTTOIMPREDICATIVEUNIVERSE.

Section Paradox.

Let  $U2 := \text{Type}$ .

Let  $U1 : U2 := \text{Type}$ .

Variable  $U0 : U1$ .

$U1$  is impredicative

Variable  $u2u1 : U2 \rightarrow U1$ .

**Hypothesis**  $u22u1\_unit : \forall (c:U2), c \rightarrow u22u1\ c$ .

$u22u1\_counit$  and  $u22u1\_coherent$  only apply to dependent product so that the equations happen in the smaller  $U1$  rather than  $U2$ . Indeed, it is not generally the case that one can project from a large universe to an impredicative universe and then get back the original type again. It would be too strong a hypothesis to require (in particular, it is not true of **Prop**). The formulation is reminiscent of the monadic characteristic of the projection from a large type to **Prop**. **Hypothesis**  $u22u1\_counit : \forall (F:U1 \rightarrow U1), u22u1\ (\forall A, F\ A) \rightarrow (\forall A, F\ A)$ .

**Hypothesis**  $u22u1\_coherent : \forall (F:U1 \rightarrow U1) (f:\forall x:U1, F\ x) (x:U1),$   
 $u22u1\_counit\ _\text{ (}u22u1\_unit\ _\text{ f)}\ x = f\ x$ .

**$U0$  is a retract of  $U1$**

**Variable**  $u02u1 : U0 \rightarrow U1$ .

**Variable**  $u12u0 : U1 \rightarrow U0$ .

**Hypothesis**  $u12u0\_unit : \forall (b:U1), b \rightarrow u02u1\ (u12u0\ b)$ .

**Hypothesis**  $u12u0\_counit : \forall (b:U1), u02u1\ (u12u0\ b) \rightarrow b$ .

### 33.2.1 Paradox

```

```
Lemma constructive_definite_description :
```

```
  ∀ (A : Type) (P : A → Prop),  
    (∃! x, P x) → { x : A | P x }.
```

```
Lemma functional_choice :
```

```
  ∀ (A B : Type) (R : A → B → Prop),  
    (∀ x : A, ∃ y : B, R x y) →  
    (∃ f : A → B, ∀ x : A, R x (f x)).
```

## Chapter 35

# Library **Coq.Logic.JMeq**

John Major's Equality as proposed by Conor McBride

Reference:

*McBride* Elimination with a Motive, Proceedings of TYPES 2000, LNCS 2277, pp 197-216, 2002.

**Set Implicit Arguments.**

**Inductive** JMeq (A:Type) (x:A) :  $\forall$  B:Type, B  $\rightarrow$  Prop :=  
JMeq\_refl : JMeq x x.

**Hint Resolve** JMeq\_refl.

**Definition** JMeq\_hom {A : Type} (x y : A) := JMeq x y.

**Lemma** JMeq\_sym :  $\forall$  (A B:Type) (x:A) (y:B), JMeq x y  $\rightarrow$  JMeq y x.

**Hint Immediate** JMeq\_sym.

**Lemma** JMeq\_trans :

$\forall$  (A B C:Type) (x:A) (y:B) (z:C), JMeq x y  $\rightarrow$  JMeq y z  $\rightarrow$  JMeq x z.

**Axiom** JMeq\_eq :  $\forall$  (A:Type) (x y:A), JMeq x y  $\rightarrow$  x = y.

**Lemma** JMeq\_ind :  $\forall$  (A:Type) (x:A) (P:A  $\rightarrow$  Prop),  
P x  $\rightarrow \forall$  y, JMeq x y  $\rightarrow$  P y.

**Lemma** JMeq\_rec :  $\forall$  (A:Type) (x:A) (P:A  $\rightarrow$  Set),  
P x  $\rightarrow \forall$  y, JMeq x y  $\rightarrow$  P y.

**Lemma** JMeq\_rect :  $\forall$  (A:Type) (x:A) (P:A  $\rightarrow$  Type),  
P x  $\rightarrow \forall$  y, JMeq x y  $\rightarrow$  P y.

**Lemma** JMeq\_ind\_r :  $\forall$  (A:Type) (x:A) (P:A  $\rightarrow$  Prop),  
P x  $\rightarrow \forall$  y, JMeq y x  $\rightarrow$  P y.

**Lemma** JMeq\_rec\_r :  $\forall$  (A:Type) (x:A) (P:A  $\rightarrow$  Set),  
P x  $\rightarrow \forall$  y, JMeq y x  $\rightarrow$  P y.

**Lemma** JMeq\_rect\_r :  $\forall$  (A:Type) (x:A) (P:A  $\rightarrow$  Type),  
P x  $\rightarrow \forall$  y, JMeq y x  $\rightarrow$  P y.

**Lemma** JMeq\_congr :

$\forall (A:\text{Type}) (x:A) (B:\text{Type}) (f:A \rightarrow B) (y:A), \text{JMeq } x \ y \rightarrow f \ x = f \ y.$   
 $\text{JMeq}$  is equivalent to  $\text{eq\_dep Type (fun } X \Rightarrow X)$

Require Import Eqdep.

Lemma JMeq\_eq\_dep\_id :

$\forall (A \ B:\text{Type}) (x:A) (y:B), \text{JMeq } x \ y \rightarrow \text{eq\_dep Type (fun } X \Rightarrow X) \ A \ x \ B \ y.$

Lemma eq\_dep\_id\_JMeq :

$\forall (A \ B:\text{Type}) (x:A) (y:B), \text{eq\_dep Type (fun } X \Rightarrow X) \ A \ x \ B \ y \rightarrow \text{JMeq } x \ y.$

$\text{eq\_dep } U \ P \ p \ x \ q \ y$  is strictly finer than  $\text{JMeq } (P \ p) \ x \ (P \ q) \ y$

Lemma eq\_dep\_JMeq :

$\forall U \ P \ p \ x \ q \ y, \text{eq\_dep } U \ P \ p \ x \ q \ y \rightarrow \text{JMeq } x \ y.$

Lemma eq\_dep\_strictly\_stronger\_JMeq :

$\exists U \ P \ p \ q \ x \ y, \text{JMeq } x \ y \wedge \neg \text{eq\_dep } U \ P \ p \ x \ q \ y.$

However, when the dependencies are equal,  $\text{JMeq } (P \ p) \ x \ (P \ q) \ y$  is as strong as  $\text{eq\_dep } U \ P \ p \ x \ q \ y$  (this uses  $\text{JMeq\_eq}$ )

Lemma JMeq\_eq\_dep :

$\forall U \ (P:U \rightarrow \text{Prop}) \ p \ q \ (x:P \ p) \ (y:P \ q),$   
 $p = q \rightarrow \text{JMeq } x \ y \rightarrow \text{eq\_dep } U \ P \ p \ x \ q \ y.$

Notation sym\_JMeq := JMeq\_sym (*only parsing*).

Notation trans\_JMeq := JMeq\_trans (*only parsing*).

## Chapter 36

# Library **Coq.Logic.ProofIrrelevanceFacts**

This defines the functor that build consequences of proof-irrelevance

```
Require Export EqdepFacts.
```

```
Module Type PROOFIRRELEVANCE.
```

```
  Axiom proof_irrelevance :  $\forall (P:\text{Prop}) (p1\ p2:P), p1 = p2$ .
```

```
End PROOFIRRELEVANCE.
```

```
Module PROOFIRRELEVANCETHEORY (M:PROOFIRRELEVANCE).
```

Proof-irrelevance implies uniqueness of reflexivity proofs

```
Module EQ_RECT_EQ.
```

```
  Lemma eq_rect_eq :
```

```
     $\forall (U:\text{Type}) (p:U) (Q:U \rightarrow \text{Type}) (x:Q\ p) (h:p = p),$   
     $x = \text{eq\_rect}\ p\ Q\ x\ p\ h.$ 
```

```
End EQ_RECT_EQ.
```

Export the theory of injective dependent elimination

```
Module EQDEPTHEORY := EQDEPTHEORY(EQ_RECT_EQ).
```

```
Export EqdepTheory.
```

```
Scheme eq_indd := Induction for eq Sort Prop.
```

We derive the irrelevance of the membership property for subsets

```
Lemma subset_eq_compat :
```

```
   $\forall (U:\text{Type}) (P:U \rightarrow \text{Prop}) (x\ y:U) (p:P\ x) (q:P\ y),$   
   $x = y \rightarrow \text{exist}\ P\ x\ p = \text{exist}\ P\ y\ q.$ 
```

```
Lemma subsetT_eq_compat :
```

```
   $\forall (U:\text{Type}) (P:U \rightarrow \text{Prop}) (x\ y:U) (p:P\ x) (q:P\ y),$   
   $x = y \rightarrow \text{existT}\ P\ x\ p = \text{existT}\ P\ y\ q.$ 
```

```
End PROOFIRRELEVANCETHEORY.
```

## Chapter 37

# Library **Coq.Logic.ProofIrrelevance**

This file axiomatizes proof-irrelevance and derives some consequences

```
Require Import ProofIrrelevanceFacts.
```

```
Axiom proof_irrelevance :  $\forall (P:\mathbf{Prop}) (p1\ p2:P), p1 = p2$ .
```

```
Module PI. Definition proof_irrelevance := proof_irrelevance. End PI.
```

```
Module PROOFIRRELEVANCETHEORY := PROOFIRRELEVANCETHEORY(PI).
```

```
Export ProofIrrelevanceTheory.
```

## Chapter 38

# Library **Coq.Logic.RelationalChoice**

This file axiomatizes the relational form of the axiom of choice

```
Axiom relational_choice :  
  ∀ (A B : Type) (R : A → B → Prop),  
    (∀ x : A, ∃ y : B, R x y) →  
    ∃ R' : A → B → Prop,  
      subrelation R' R ∧ ∀ x : A, ∃! y : B, R' x y.
```

## Chapter 39

# Library `Coq.Logic.SetIsType`

### 39.1 The Set universe seen as a synonym for Type

After loading this file, Set becomes just another name for Type. This allows easily performing a Set-to-Type migration, or at least test whether a development relies or not on specific features of Set: simply insert some Require Export of this file at starting points of the development and try to recompile...

**Notation** "'Set'" := **Type** (*only parsing*).

# Chapter 40

## Library **Coq.Logic.FinFun**

### 40.1 Functions on finite domains

Main result : for functions  $f:A \rightarrow B$  with finite  $A$ ,  $f$  injective  $\leftrightarrow$   $f$  bijective  $\leftrightarrow$   $f$  surjective.

**Require Import** List Compare\_dec EqNat Decidable ListDec. **Require** Fin.  
**Set Implicit Arguments.**

General definitions

**Definition** Injective  $\{A\ B\}$   $(f : A \rightarrow B) :=$   
 $\forall\ x\ y, f\ x = f\ y \rightarrow x = y.$

**Definition** Surjective  $\{A\ B\}$   $(f : A \rightarrow B) :=$   
 $\forall\ y, \exists\ x, f\ x = y.$

**Definition** Bijective  $\{A\ B\}$   $(f : A \rightarrow B) :=$   
 $\exists\ g:B \rightarrow A, (\forall\ x, g\ (f\ x) = x) \wedge (\forall\ y, f\ (g\ y) = y).$

Finiteness is defined here via exhaustive list enumeration

**Definition** Full  $\{A:\text{Type}\}$   $(l:\text{list } A) := \forall\ a:A, \text{In } a\ l.$

**Definition** Finite  $(A:\text{Type}) := \exists\ (l:\text{list } A), \text{Full } l.$

In many following proofs, it will be convenient to have list enumerations without duplicates. As soon as we have decidability of equality (in Prop), this is equivalent to the previous notion.

**Definition** Listing  $\{A:\text{Type}\}$   $(l:\text{list } A) := \text{NoDup } l \wedge \text{Full } l.$

**Definition** Finite'  $(A:\text{Type}) := \exists\ (l:\text{list } A), \text{Listing } l.$

**Lemma** Finite\_alt  $A\ (d:\text{decidable\_eq } A) : \text{Finite } A \leftrightarrow \text{Finite' } A.$

Injections characterized in term of lists

**Lemma** Injective\_map\_NoDup  $A\ B\ (f:A \rightarrow B)\ (l:\text{list } A) :$   
 $\text{Injective } f \rightarrow \text{NoDup } l \rightarrow \text{NoDup } (\text{map } f\ l).$

**Lemma** Injective\_list\_carac  $A\ B\ (d:\text{decidable\_eq } A)\ (f:A \rightarrow B) :$   
 $\text{Injective } f \leftrightarrow (\forall\ l, \text{NoDup } l \rightarrow \text{NoDup } (\text{map } f\ l)).$

**Lemma** Injective\_carac  $A\ B\ (l:\text{list } A) : \text{Listing } l \rightarrow$   
 $\forall\ (f:A \rightarrow B), \text{Injective } f \leftrightarrow \text{NoDup } (\text{map } f\ l).$

Surjection characterized in term of lists

**Lemma** `Surjective_list_carac`  $A\ B\ (f:A \rightarrow B)$ :  
 $\text{Surjective } f \leftrightarrow (\forall lB, \exists lA, \text{incl } lB\ (\text{map } f\ lA)).$

**Lemma** `Surjective_carac`  $A\ B : \text{Finite } B \rightarrow \text{decidable\_eq } B \rightarrow$   
 $\forall f:A \rightarrow B, \text{Surjective } f \leftrightarrow (\exists lA, \text{Listing } (\text{map } f\ lA)).$

Main result :

**Lemma** `Endo_Injective_Surjective` :  
 $\forall A, \text{Finite } A \rightarrow \text{decidable\_eq } A \rightarrow$   
 $\forall f:A \rightarrow A, \text{Injective } f \leftrightarrow \text{Surjective } f.$

An injective and surjective function is bijective. We need here stronger hypothesis : decidability of equality in Type.

**Definition** `EqDec`  $(A:\text{Type}) := \forall x\ y:A, \{x=y\} + \{x \neq y\}.$

First, we show that a surjective  $f$  has an inverse function  $g$  such that  $f.g = \text{id}$ .

**Lemma** `Finite_Empty_or_not`  $A$  :  
 $\text{Finite } A \rightarrow (A \rightarrow \text{False}) \vee \exists a:A, \text{True}.$

**Lemma** `Surjective_inverse` :  
 $\forall A\ B, \text{Finite } A \rightarrow \text{EqDec } B \rightarrow$   
 $\forall f:A \rightarrow B, \text{Surjective } f \rightarrow$   
 $\exists g:B \rightarrow A, \forall x, f\ (g\ x) = x.$

Same, with more knowledge on the inverse function:  $g.f = f.g = \text{id}$

**Lemma** `Injective_Surjective_Bijective` :  
 $\forall A\ B, \text{Finite } A \rightarrow \text{EqDec } B \rightarrow$   
 $\forall f:A \rightarrow B, \text{Injective } f \rightarrow \text{Surjective } f \rightarrow \text{Bijective } f.$

An example of finite type : *Fin.t*

**Lemma** `Fin_Finite`  $n : \text{Finite } (\text{Fin.t } n).$

Instead of working on a finite subset of nat, another solution is to use restricted  $\text{nat} \rightarrow \text{nat}$  functions, and to consider them only below a certain bound  $n$ .

**Definition** `bFun`  $n\ (f:\text{nat} \rightarrow \text{nat}) := \forall x, x < n \rightarrow f\ x < n.$

**Definition** `bInjective`  $n\ (f:\text{nat} \rightarrow \text{nat}) :=$   
 $\forall x\ y, x < n \rightarrow y < n \rightarrow f\ x = f\ y \rightarrow x = y.$

**Definition** `bSurjective`  $n\ (f:\text{nat} \rightarrow \text{nat}) :=$   
 $\forall y, y < n \rightarrow \exists x, x < n \wedge f\ x = y.$

We show that this is equivalent to the use of *Fin.t n*.

**Module** `FIN2RESTRICT`.

**Notation** `n2f`  $:= \text{Fin.of\_nat\_lt}.$

**Definition** `f2n`  $\{n\}\ (x:\text{Fin.t } n) := \text{proj1\_sig } (\text{Fin.to\_nat } x).$

**Definition** `f2n_ok`  $n\ (x:\text{Fin.t } n) : \text{f2n } x < n := \text{proj2\_sig } (\text{Fin.to\_nat } x).$

**Definition** `n2f_f2n`  $:= \forall n\ x, \text{n2f } (\text{f2n\_ok } x) = x := @\text{Fin.of\_nat\_to\_nat\_inv}.$

**Definition**  $\text{f2n\_n2f } x \ n \ h : \text{f2n } (\text{n2f } h) = x := \text{f\_equal } (\text{@proj1\_sig } \_ \_) (\text{@Fin.to\_nat\_of\_nat } x \ n \ h)$ .

**Definition**  $\text{n2f\_ext} : \forall x \ n \ h \ h', \text{n2f } h = \text{n2f } h' := \text{@Fin.of\_nat\_ext}$ .

**Definition**  $\text{f2n\_inj} : \forall n \ x \ y, \text{f2n } x = \text{f2n } y \rightarrow x = y := \text{@Fin.to\_nat\_inj}$ .

**Definition**  $\text{extend } n \ (f : \text{Fin.t } n \rightarrow \text{Fin.t } n) : (\text{nat} \rightarrow \text{nat}) :=$

```

fun x =>
  match le_lt_dec n x with
  | left _ => 0
  | right h => f2n (f (n2f h))
end.

```

**Definition**  $\text{restrict } n \ (f : \text{nat} \rightarrow \text{nat}) (hf : \text{bFun } n \ f) : (\text{Fin.t } n \rightarrow \text{Fin.t } n) :=$

```

fun x => let (x', h) := Fin.to_nat x in n2f (hf _ h).

```

**Ltac**  $\text{break\_dec } H :=$

```

let H' := fresh "H" in
destruct le_lt_dec as [H'|H'];
|elim (Lt.le_not_lt _ _ H' H)
|try rewrite (n2f_ext H' H) in *; try clear H'.

```

**Lemma**  $\text{extend\_ok } n \ f : \text{bFun } n \ (\text{@extend } n \ f)$ .

**Lemma**  $\text{extend\_f2n } n \ f \ (x : \text{Fin.t } n) : \text{extend } f \ (\text{f2n } x) = \text{f2n } (f \ x)$ .

**Lemma**  $\text{extend\_n2f } n \ f \ x \ (h : x < n) : \text{n2f } (\text{extend\_ok } f \ h) = f \ (\text{n2f } h)$ .

**Lemma**  $\text{restrict\_f2n } n \ f \ hf \ (x : \text{Fin.t } n) :$

$\text{f2n } (\text{@restrict } n \ f \ hf \ x) = f \ (\text{f2n } x)$ .

**Lemma**  $\text{restrict\_n2f } n \ f \ hf \ x \ (h : x < n) :$

$\text{@restrict } n \ f \ hf \ (\text{n2f } h) = \text{n2f } (hf \ _ \ h)$ .

**Lemma**  $\text{extend\_surjective } n \ f :$

$\text{bSurjective } n \ (\text{@extend } n \ f) \leftrightarrow \text{Surjective } f$ .

**Lemma**  $\text{extend\_injective } n \ f :$

$\text{bInjective } n \ (\text{@extend } n \ f) \leftrightarrow \text{Injective } f$ .

**Lemma**  $\text{restrict\_surjective } n \ f \ h :$

$\text{Surjective } (\text{@restrict } n \ f \ h) \leftrightarrow \text{bSurjective } n \ f$ .

**Lemma**  $\text{restrict\_injective } n \ f \ h :$

$\text{Injective } (\text{@restrict } n \ f \ h) \leftrightarrow \text{bInjective } n \ f$ .

**End**  $\text{FIN2RESTRICT}$ .

**Import**  $\text{Fin2Restrict}$ .

We can now use Proof via the equivalence ...

**Lemma**  $\text{bInjective\_bSurjective } n \ (f : \text{nat} \rightarrow \text{nat}) :$

$\text{bFun } n \ f \rightarrow (\text{bInjective } n \ f \leftrightarrow \text{bSurjective } n \ f)$ .

**Lemma**  $\text{bSurjective\_bBijective } n \ (f : \text{nat} \rightarrow \text{nat}) :$

$\text{bFun } n \ f \rightarrow \text{bSurjective } n \ f \rightarrow$

$\exists g, \text{bFun } n \ g \wedge \forall x, x < n \rightarrow g \ (f \ x) = x \wedge f \ (g \ x) = x$ .

## Chapter 41

# Library **Coq.Unicode.Utf8**

**Require Export** Utf8\_core.

**Notation** "x ≤ y" := (**le** x y) (**at level** 70, **no associativity**).

**Notation** "x ≥ y" := (**ge** x y) (**at level** 70, **no associativity**).

## Chapter 42

# Library Coq.Unicode.Utf8\_core

```
Notation "∀ x .. y , P" := (∀ x, .. (∀ y, P) ..)
  (at level 200, x binder, y binder, right associativity) : type_scope.
Notation "∃ x .. y , P" := (∃ x, .. (∃ y, P) ..)
  (at level 200, x binder, y binder, right associativity) : type_scope.
Notation "x ∨ y" := (x ∨ y) (at level 85, right associativity) : type_scope.
Notation "x ∧ y" := (x ∧ y) (at level 80, right associativity) : type_scope.
Notation "x → y" := (x → y)

Notation "'λ' x .. y , t" := (fun x ⇒ .. (fun y ⇒ t) ..)
  (at level 200, x binder, y binder, right associativity).
```

## Chapter 43

# Library **Coq.Arith.PeanoNat**

**Require Import** NAXioms NProperties OrdersFacts.

Implementation of *NAXiomsSig* by *nat*

**Module** NAT

<: NAXIOMSIG

<: USUALDECIDABLETYPEFULL

<: ORDEREDTYPEFULL

<: TOTALORDER.

Operations over *nat* are defined in a separate module

**Include** COQ.INIT.NAT.

When including property functors, inline t eq zero one two lt le succ

All operations are well-defined (trivial here since eq is Leibniz)

**Definition** eq\_equiv : Equivalence (@eq nat) := eq\_equivalence.

**Program Instance** succ\_wd : Proper (eq==>eq) S.

**Program Instance** pred\_wd : Proper (eq==>eq) pred.

**Program Instance** add\_wd : Proper (eq==>eq==>eq) plus.

**Program Instance** sub\_wd : Proper (eq==>eq==>eq) minus.

**Program Instance** mul\_wd : Proper (eq==>eq==>eq) mult.

**Program Instance** pow\_wd : Proper (eq==>eq==>eq) pow.

**Program Instance** div\_wd : Proper (eq==>eq==>eq) div.

**Program Instance** mod\_wd : Proper (eq==>eq==>eq) modulo.

**Program Instance** lt\_wd : Proper (eq==>eq==>iff) lt.

**Program Instance** testbit\_wd : Proper (eq==>eq==>eq) testbit.

Bi-directional induction.

**Theorem** bi\_induction :

$\forall A : \text{nat} \rightarrow \text{Prop}, \text{Proper } (eq ==> iff) A \rightarrow$   
 $A\ 0 \rightarrow (\forall n : \text{nat}, A\ n \leftrightarrow A\ (S\ n)) \rightarrow \forall n : \text{nat}, A\ n.$

Recursion function

**Definition** recursion {A} : A → (nat → A → A) → nat → A :=

```

nat_rect (fun _ => A).
Instance recursion_wd {A} (Aeq : relation A) :
  Proper (Aeq ==> (eq==>Aeq==>Aeq) ==> eq ==> Aeq) recursion.
Theorem recursion_0 :
  ∀ {A} (a : A) (f : nat → A → A), recursion a f 0 = a.
Theorem recursion_succ :
  ∀ {A} (Aeq : relation A) (a : A) (f : nat → A → A),
  Aeq a a → Proper (eq==>Aeq==>Aeq) f →
  ∀ n : nat, Aeq (recursion a f (S n)) (f n (recursion a f n)).

```

### 43.0.1 Remaining constants not defined in Coq.Init.Nat

NB: Aliasing *le* is mandatory, since only a Definition can implement an interface Parameter...

```

Definition eq := @Logic.eq nat.
Definition le := Peano.le.
Definition lt := Peano.lt.

```

### 43.0.2 Basic specifications : pred add sub mul

```

Lemma pred_succ n : pred (S n) = n.
Lemma pred_0 : pred 0 = 0.
Lemma one_succ : 1 = S 0.
Lemma two_succ : 2 = S 1.
Lemma add_0_l n : 0 + n = n.
Lemma add_succ_l n m : (S n) + m = S (n + m).
Lemma sub_0_r n : n - 0 = n.
Lemma sub_succ_r n m : n - (S m) = pred (n - m).
Lemma mul_0_l n : 0 × n = 0.
Lemma mul_succ_l n m : S n × m = n × m + m.
Lemma lt_succ_r n m : n < S m ↔ n ≤ m.

```

### 43.0.3 Boolean comparisons

```

Lemma eqb_eq n m : eqb n m = true ↔ n = m.
Lemma leb_le n m : (n <=? m) = true ↔ n ≤ m.
Lemma ltb_lt n m : (n <? m) = true ↔ n < m.

```

### 43.0.4 Decidability of equality over *nat*.

```

Lemma eq_dec : ∀ n m : nat, {n = m} + {n ≠ m}.

```

### 43.0.5 Ternary comparison

With *nat*, it would be easier to prove first *compare\_spec*, then the properties below. But then we wouldn't be able to benefit from functor *BoolOrderFacts*

**Lemma** *compare\_eq\_iff*  $n\ m : (n\ ?=\ m) = \text{Eq} \leftrightarrow n = m$ .

**Lemma** *compare\_lt\_iff*  $n\ m : (n\ ?=\ m) = \text{Lt} \leftrightarrow n < m$ .

**Lemma** *compare\_le\_iff*  $n\ m : (n\ ?=\ m) \neq \text{Gt} \leftrightarrow n \leq m$ .

**Lemma** *compare\_antisym*  $n\ m : (m\ ?=\ n) = \text{CompOpp}\ (n\ ?=\ m)$ .

**Lemma** *compare\_succ*  $n\ m : (\text{S } n\ ?=\ \text{S } m) = (n\ ?=\ m)$ .

### 43.0.6 Minimum, maximum

**Lemma** *max\_l*  $\forall\ n\ m, m \leq n \rightarrow \text{max } n\ m = n$ .

**Lemma** *max\_r*  $\forall\ n\ m, n \leq m \rightarrow \text{max } n\ m = m$ .

**Lemma** *min\_l*  $\forall\ n\ m, n \leq m \rightarrow \text{min } n\ m = n$ .

**Lemma** *min\_r*  $\forall\ n\ m, m \leq n \rightarrow \text{min } n\ m = m$ .

Some more advanced properties of comparison and orders, including *compare\_spec* and *lt\_irrefl* and *lt\_eq\_cases*.

**Include** *BOOLORDERFACTS*.

We can now derive all properties of basic functions and orders, and use these properties for proving the specs of more advanced functions.

**Include** *NBASICPROP* <+ *USUALMINMAXLOGICALPROPERTIES* <+ *USUALMINMAXDECPROPERTIES*.

### 43.0.7 Power

**Lemma** *pow\_neg\_r*  $a\ b : b < 0 \rightarrow a^b = 0$ .

**Lemma** *pow\_0\_r*  $a : a^0 = 1$ .

**Lemma** *pow\_succ\_r*  $a\ b : 0 \leq b \rightarrow a^{(\text{S } b)} = a \times a^b$ .

### 43.0.8 Square

**Lemma** *square\_spec*  $n : \text{square } n = n \times n$ .

### 43.0.9 Parity

**Definition** *Even*  $n := \exists\ m, n = 2 \times m$ .

**Definition** *Odd*  $n := \exists\ m, n = 2 \times m + 1$ .

**Module** *PRIVATE\_PARITY*.

**Lemma** *Even\_1*  $\neg \text{Even } 1$ .

**Lemma** *Even\_2*  $n : \text{Even } n \leftrightarrow \text{Even } (\text{S } (\text{S } n))$ .

Lemma Odd\_0 :  $\neg$  Odd 0.  
 Lemma Odd\_2 n : Odd n  $\leftrightarrow$  Odd (S (S n)).  
 End PRIVATE\_PARITY.  
 Import Private\_Parity.  
 Lemma even\_spec :  $\forall$  n, even n = true  $\leftrightarrow$  Even n.  
 Lemma odd\_spec :  $\forall$  n, odd n = true  $\leftrightarrow$  Odd n.

#### 43.0.10 Division

Lemma divmod\_spec :  $\forall$  x y q u,  $u \leq y \rightarrow$   
   let (q', u') := divmod x y q u in  
    $x + (S y) * q + (y - u) = (S y) * q' + (y - u') \wedge u' \leq y$ .  
 Lemma div\_mod x y :  $y \neq 0 \rightarrow x = y * (x / y) + x \bmod y$ .  
 Lemma mod\_bound\_pos x y :  $0 \leq x \rightarrow 0 < y \rightarrow 0 \leq x \bmod y < y$ .

#### 43.0.11 Square root

Theorem lt_dec n m : {n < m} + {¬ n < m}.
Theorem gt_dec n m : {n > m} + {¬ n > m}.
Theorem ge_dec n m : {n ≥ m} + {¬ n ≥ m}.
```

Proofs of decidability

```
Theorem dec_le n m : decidable (n ≤ m).
Theorem dec_lt n m : decidable (n < m).
Theorem dec_gt n m : decidable (n > m).
Theorem dec_ge n m : decidable (n ≥ m).
Theorem not_eq n m : n ≠ m → n < m ∨ m < n.
Theorem not_le n m : ¬ n ≤ m → n > m.
Theorem not_gt n m : ¬ n > m → n ≤ m.
Theorem not_ge n m : ¬ n ≥ m → n < m.
Theorem not_lt n m : ¬ n < m → n ≥ m.
```

A ternary comparison function in the spirit of *Z.compare*. See now *Nat.compare* and its properties. In scope *nat\_scope*, the notation for *Nat.compare* is “*?=*”

**Notation** *nat\_compare* := *Nat.compare* (*compat* "8.4").

**Notation** *nat\_compare\_spec* := *Nat.compare\_spec* (*compat* "8.4").

**Notation** *nat\_compare\_eq\_iff* := *Nat.compare\_eq\_iff* (*compat* "8.4").

**Notation** *nat\_compare\_S* := *Nat.compare\_succ* (*compat* "8.4").

**Lemma** *nat\_compare\_lt* *n m* :  $n < m \leftrightarrow (n \text{ ?= } m) = \text{Lt}$ .

**Lemma** *nat\_compare\_gt* *n m* :  $n > m \leftrightarrow (n \text{ ?= } m) = \text{Gt}$ .

**Lemma** *nat\_compare\_le* *n m* :  $n \leq m \leftrightarrow (n \text{ ?= } m) \neq \text{Gt}$ .

**Lemma** *nat\_compare\_ge* *n m* :  $n \geq m \leftrightarrow (n \text{ ?= } m) \neq \text{Lt}$ .

Some projections of the above equivalences.

**Lemma** *nat\_compare\_eq* *n m* :  $(n \text{ ?= } m) = \text{Eq} \rightarrow n = m$ .

**Lemma** *nat\_compare\_Lt\_Lt* *n m* :  $(n \text{ ?= } m) = \text{Lt} \rightarrow n < m$ .

**Lemma** *nat\_compare\_Gt\_gt* *n m* :  $(n \text{ ?= } m) = \text{Gt} \rightarrow n > m$ .

A previous definition of *nat\_compare* in terms of *lt\_eq\_lt\_dec*. The new version avoids the creation of proof parts.

**Definition** *nat\_compare\_alt* (*n m*:*nat*) :=

```
match lt_eq_lt_dec n m with
| inleft (left _) => Lt
| inleft (right _) => Eq
| inright _ => Gt
end.
```

**Lemma** *nat\_compare\_equiv* *n m* :  $(n \text{ ?= } m) = \text{nat\_compare\_alt } n \text{ } m$ .

A boolean version of *le* over *nat*. See now *Nat.leb* and its properties. In scope *nat\_scope*, the notation for *Nat.leb* is “*<=?*”

**Notation** *leb* := *Nat.leb* (*compat* "8.4").

**Notation** *leb\_iff* := *Nat.leb\_le* (*compat* "8.4").

**Lemma** *leb\_iff\_conv* *m n* :  $(n <=? m) = \text{false} \leftrightarrow m < n$ .

**Lemma** *leb\_correct* *m n* :  $m \leq n \rightarrow (m <=? n) = \text{true}$ .

**Lemma** *leb\_complete* *m n* :  $(m <=? n) = \text{true} \rightarrow m \leq n$ .

**Lemma** *leb\_correct\_conv* *m n* :  $m < n \rightarrow (n <=? m) = \text{false}$ .

**Lemma** *leb\_complete\_conv* *m n* :  $(n <=? m) = \text{false} \rightarrow m < n$ .

**Lemma** *leb\_compare* *n m* :  $(n <=? m) = \text{true} \leftrightarrow (n \text{ ?= } m) \neq \text{Gt}$ .

## Chapter 49

# Library Coq.Arith.Compare

Equality is decidable on *nat*

Local Open Scope *nat\_scope*.

Notation *not\_eq\_sym* := *not\_eq\_sym* (*only parsing*).

Implicit Types *m n p q* : *nat*.

Require Import Arith\_base.

Require Import Peano\_dec.

Lemma *le\_le\_S\_eq* :  $\forall n\ m, n \leq m \rightarrow S\ n \leq m \vee n = m$ .

Lemma *discrete\_nat* :

$\forall n\ m, n < m \rightarrow S\ n = m \vee (\exists r : \text{nat}, m = S\ (S\ (n + r)))$ .

Require Export Wf\_nat.

Require Export Min Max.

## Chapter 50

# Library Coq.Arith.Div2

Nota : this file is OBSOLETE, and left only for compatibility. Please consider using *Nat.div2* directly, and results about it (see file PeanoNat).

Require Import PeanoNat Even.

Local Open Scope nat\_scope.

Implicit Type n : nat.

Here we define  $n/2$  and prove some of its properties

Notation div2 := Nat.div2 (compat "8.4").

Since *div2* is recursively defined on 0, 1 and  $(S (S n))$ , it is useful to prove the corresponding induction principle

Lemma ind\_0\_1\_SS :

$\forall P:\text{nat} \rightarrow \text{Prop},$

$P\ 0 \rightarrow P\ 1 \rightarrow (\forall n, P\ n \rightarrow P\ (S\ (S\ n))) \rightarrow \forall n, P\ n.$

$0 < n \Rightarrow n/2 < n$

Lemma lt\_div2 n :  $0 < n \rightarrow \text{div2}\ n < n.$

Hint Resolve lt\_div2: arith.

Properties related to the parity

Lemma even\_div2 n :  $\text{even}\ n \rightarrow \text{div2}\ n = \text{div2}\ (S\ n).$

Lemma odd\_div2 n :  $\text{odd}\ n \rightarrow S\ (\text{div2}\ n) = \text{div2}\ (S\ n).$

Lemma div2\_even n :  $\text{div2}\ n = \text{div2}\ (S\ n) \rightarrow \text{even}\ n.$

Lemma div2\_odd n :  $S\ (\text{div2}\ n) = \text{div2}\ (S\ n) \rightarrow \text{odd}\ n.$

Hint Resolve even\_div2 div2\_even odd\_div2 div2\_odd: arith.

Lemma even\_odd\_div2 n :

$(\text{even}\ n \leftrightarrow \text{div2}\ n = \text{div2}\ (S\ n)) \wedge$

$(\text{odd}\ n \leftrightarrow S\ (\text{div2}\ n) = \text{div2}\ (S\ n)).$

Properties related to the double  $(2n)$

Notation double := Nat.double (compat "8.4").

Hint Unfold double Nat.double: *arith*.

Lemma double\_S  $n$  : double (S  $n$ ) = S (S (double  $n$ )).

Lemma double\_plus  $n$   $m$  : double ( $n + m$ ) = double  $n$  + double  $m$ .

Hint Resolve double\_S: *arith*.

Lemma even\_odd\_double  $n$  :

(even  $n \leftrightarrow n = \text{double} (\text{div2 } n)$ )  $\wedge$  (odd  $n \leftrightarrow n = \text{S} (\text{double} (\text{div2 } n))$ ).

Specializations

Lemma even\_double  $n$  : even  $n \rightarrow n = \text{double} (\text{div2 } n)$ .

Lemma double\_even  $n$  :  $n = \text{double} (\text{div2 } n) \rightarrow \text{even } n$ .

Lemma odd\_double  $n$  : odd  $n \rightarrow n = \text{S} (\text{double} (\text{div2 } n))$ .

Lemma double\_odd  $n$  :  $n = \text{S} (\text{double} (\text{div2 } n)) \rightarrow \text{odd } n$ .

Hint Resolve even\_double double\_even odd\_double double\_odd: *arith*.

Application:

- if  $n$  is even then there is a  $p$  such that  $n = 2p$
- if  $n$  is odd then there is a  $p$  such that  $n = 2p+1$

(Immediate: it is  $n/2$ )

Lemma even\_2n :  $\forall n, \text{even } n \rightarrow \{p : \text{nat} \mid n = \text{double } p\}$ .

Lemma odd\_S2n :  $\forall n, \text{odd } n \rightarrow \{p : \text{nat} \mid n = \text{S} (\text{double } p)\}$ .

Doubling before dividing by two brings back to the initial number.

Lemma div2\_double  $n$  : div2 ( $2 \times n$ ) =  $n$ .

Lemma div2\_double\_plus\_one  $n$  : div2 (S ( $2 \times n$ )) =  $n$ .

## Chapter 51

# Library `Coq.Arith.EqNat`

```
Require Import PeanoNat.  
Local Open Scope nat_scope.
```

Equality on natural numbers

### 51.1 Propositional equality

```
Fixpoint eq_nat n m : Prop :=  
  match n, m with  
  | O, O => True  
  | O, S _ => False  
  | S _, O => False  
  | S n1, S m1 => eq_nat n1 m1  
  end.
```

**Theorem** `eq_nat_refl`  $n$  : `eq_nat`  $n$   $n$ .

**Hint** `Resolve` `eq_nat_refl`: *arith v62*.

*eq* restricted to *nat* and *eq\_nat* are equivalent

**Theorem** `eq_nat_is_eq`  $n$   $m$  : `eq_nat`  $n$   $m$   $\leftrightarrow$   $n = m$ .

**Lemma** `eq_eq_nat`  $n$   $m$  :  $n = m \rightarrow$  `eq_nat`  $n$   $m$ .

**Lemma** `eq_nat_eq`  $n$   $m$  : `eq_nat`  $n$   $m \rightarrow$   $n = m$ .

**Hint** `Immediate` `eq_eq_nat` `eq_nat_eq`: *arith v62*.

**Theorem** `eq_nat_elim` :

$\forall n (P:\text{nat} \rightarrow \text{Prop}), P\ n \rightarrow \forall m, \text{eq\_nat}\ n\ m \rightarrow P\ m$ .

**Theorem** `eq_nat_decide` :  $\forall n\ m, \{\text{eq\_nat}\ n\ m\} + \{\neg \text{eq\_nat}\ n\ m\}$ .

### 51.2 Boolean equality on *nat*.

We reuse the one already defined in module *Nat*. In scope *nat\_scope*, the notation “=” can be used.

**Notation** `beq_nat` := `Nat.eqb (compat "8.4")`.

**Notation** `beq_nat_true_iff` := `Nat.eqb_eq (compat "8.4")`.

**Notation** `beq_nat_false_iff` := `Nat.eqb_neq (compat "8.4")`.

**Lemma** `beq_nat_refl`  $n$  : `true` =  $(n =? n)$ .

**Lemma** `beq_nat_true`  $n$   $m$  :  $(n =? m)$  = `true`  $\rightarrow n = m$ .

**Lemma** `beq_nat_false`  $n$   $m$  :  $(n =? m)$  = `false`  $\rightarrow n \neq m$ .

TODO: is it really useful here to have a `Defined` ? Otherwise we could use `Nat.eqb_eq`

**Definition** `beq_nat_eq` :  $\forall n\ m, \text{true} = (n =? m) \rightarrow n = m$ .

## Chapter 52

# Library **Coq.Arith.Euclid**

```
Require Import Mult.
Require Import Compare_dec.
Require Import Wf_nat.

Local Open Scope nat_scope.

Implicit Types a b n q r : nat.

Inductive diveucl a b : Set :=
  divex :  $\forall q\ r, b > r \rightarrow a = q \times b + r \rightarrow \text{diveucl } a\ b$ .

Lemma eucl_dev :  $\forall n, n > 0 \rightarrow \forall m:\text{nat}, \text{diveucl } m\ n$ .

Lemma quotient :
   $\forall n,$ 
   $n > 0 \rightarrow$ 
   $\forall m:\text{nat}, \{q : \text{nat} \mid \exists r : \text{nat}, m = q \times n + r \wedge n > r\}$ .

Lemma modulo :
   $\forall n,$ 
   $n > 0 \rightarrow$ 
   $\forall m:\text{nat}, \{r : \text{nat} \mid \exists q : \text{nat}, m = q \times n + r \wedge n > r\}$ .
```

## Chapter 53

# Library **Coq.Arith.Even**

Nota : this file is OBSOLETE, and left only for compatibility. Please consider instead predicates *Nat.Even* and *Nat.Odd* and Boolean functions *Nat.even* and *Nat.odd*.

Here we define the predicates *even* and *odd* by mutual induction and we prove the decidability and the exclusion of those predicates. The main results about parity are proved in the module Div2.

```
Require Import PeanoNat.  
Local Open Scope nat_scope.  
Implicit Types m n : nat.
```

### 53.1 Inductive definition of *even* and *odd*

```
Inductive even : nat → Prop :=  
  | even_O : even 0  
  | even_S : ∀ n, odd n → even (S n)  
with odd : nat → Prop :=  
  odd_S : ∀ n, even n → odd (S n).  
Hint Constructors even: arith.  
Hint Constructors odd: arith.
```

### 53.2 Equivalence with predicates *Nat.Even* and *Nat.odd*

```
Lemma even_equiv : ∀ n, even n ↔ Nat.Even n.  
Lemma odd_equiv : ∀ n, odd n ↔ Nat.Odd n.  
Basic facts  
Lemma even_or_odd n : even n ∨ odd n.  
Lemma even_odd_dec n : {even n} + {odd n}.  
Lemma not_even_and_odd n : even n → odd n → False.
```

### 53.3 Facts about *even* & *odd* wrt. *plus*

```

Ltac parity2bool :=
  rewrite ?even_equiv, ?odd_equiv, ← ?Nat.even_spec, ← ?Nat.odd_spec.

Ltac parity_binop_spec :=
  rewrite ?Nat.even_add, ?Nat.odd_add, ?Nat.even_mul, ?Nat.odd_mul.

Ltac parity_binop :=
  parity2bool; parity_binop_spec; unfold Nat.odd;
  do 2 destruct Nat.even; simpl; tauto.

Lemma even_plus_split n m :
  even (n + m) → even n ∧ even m ∨ odd n ∧ odd m.

Lemma odd_plus_split n m :
  odd (n + m) → odd n ∧ even m ∨ even n ∧ odd m.

Lemma even_even_plus n m : even n → even m → even (n + m).

Lemma odd_plus_l n m : odd n → even m → odd (n + m).

Lemma odd_plus_r n m : even n → odd m → odd (n + m).

Lemma odd_even_plus n m : odd n → odd m → even (n + m).

Lemma even_plus_aux n m :
  (odd (n + m) ↔ odd n ∧ even m ∨ even n ∧ odd m) ∧
  (even (n + m) ↔ even n ∧ even m ∨ odd n ∧ odd m).

Lemma even_plus_even_inv_r n m : even (n + m) → even n → even m.

Lemma even_plus_even_inv_l n m : even (n + m) → even m → even n.

Lemma even_plus_odd_inv_r n m : even (n + m) → odd n → odd m.

Lemma even_plus_odd_inv_l n m : even (n + m) → odd m → odd n.

Lemma odd_plus_even_inv_l n m : odd (n + m) → odd m → even n.

Lemma odd_plus_even_inv_r n m : odd (n + m) → odd n → even m.

Lemma odd_plus_odd_inv_l n m : odd (n + m) → even m → odd n.

Lemma odd_plus_odd_inv_r n m : odd (n + m) → even n → odd m.

```

### 53.4 Facts about *even* and *odd* wrt. *mult*

```

Lemma even_mult_aux n m :
  (odd (n × m) ↔ odd n ∧ odd m) ∧ (even (n × m) ↔ even n ∨ even m).

Lemma even_mult_l n m : even n → even (n × m).

Lemma even_mult_r n m : even m → even (n × m).

Lemma even_mult_inv_r n m : even (n × m) → odd n → even m.

Lemma even_mult_inv_l n m : even (n × m) → odd m → even n.

Lemma odd_mult n m : odd n → odd m → odd (n × m).

```

**Lemma** `odd_mult_inv_l`  $n\ m$  : `odd`  $(n \times m) \rightarrow$  `odd`  $n$ .

**Lemma** `odd_mult_inv_r`  $n\ m$  : `odd`  $(n \times m) \rightarrow$  `odd`  $m$ .

**Hint** `Resolve`

*even\_even\_plus odd\_even\_plus odd\_plus\_l odd\_plus\_r  
even\_mult\_l even\_mult\_r even\_mult\_l even\_mult\_r odd\_mult : arith.*

## Chapter 55

# Library Coq.Arith.Gt

Theorems about *gt* in *nat*.

This file is DEPRECATED now, see module *PeanoNat.Nat* instead, which favor *lt* over *gt*.  
*gt* is defined in *Init/Peano.v* as:

Definition gt (n m:nat) := m < n.

Require Import PeanoNat Le Lt Plus.

Local Open Scope nat\_scope.

### 55.1 Order and successor

Theorem gt\_Sn\_O n : S n > 0.

Theorem gt\_Sn\_n n : S n > n.

Theorem gt\_n\_S n m : n > m → S n > S m.

Lemma gt\_S\_n n m : S m > S n → m > n.

Theorem gt\_S n m : S n > m → n > m ∨ m = n.

Lemma gt\_pred n m : m > S n → pred m > n.

### 55.2 Irreflexivity

Lemma gt\_irrefl n : ¬ n > n.

### 55.3 Asymmetry

Lemma gt\_asym n m : n > m → ¬ m > n.

## 55.4 Relating strict and large orders

Lemma `le_not_gt`  $n\ m : n \leq m \rightarrow \neg n > m$ .

Lemma `gt_not_le`  $n\ m : n > m \rightarrow \neg n \leq m$ .

Theorem `le_S_gt`  $n\ m : \mathbf{S}\ n \leq m \rightarrow m > n$ .

Lemma `gt_S_le`  $n\ m : \mathbf{S}\ m > n \rightarrow n \leq m$ .

Lemma `gt_le_S`  $n\ m : m > n \rightarrow \mathbf{S}\ n \leq m$ .

Lemma `le_gt_S`  $n\ m : n \leq m \rightarrow \mathbf{S}\ m > n$ .

## 55.5 Transitivity

Theorem `le_gt_trans`  $n\ m\ p : m \leq n \rightarrow m > p \rightarrow n > p$ .

Theorem `gt_le_trans`  $n\ m\ p : n > m \rightarrow p \leq m \rightarrow n > p$ .

Lemma `gt_trans`  $n\ m\ p : n > m \rightarrow m > p \rightarrow n > p$ .

Theorem `gt_trans_S`  $n\ m\ p : \mathbf{S}\ n > m \rightarrow m > p \rightarrow n > p$ .

## 55.6 Comparison to 0

Theorem `gt_0_eq`  $n : n > 0 \vee 0 = n$ .

## 55.7 Simplification and compatibility

Lemma `plus_gt_reg_l`  $n\ m\ p : p + n > p + m \rightarrow n > m$ .

Lemma `plus_gt_compat_l`  $n\ m\ p : n > m \rightarrow p + n > p + m$ .

## 55.8 Hints

Hint `Resolve` `gt_Sn_O` `gt_Sn_n` `gt_n_S` : *arith v62*.

  (compat "8.4").

```

## 61.3 Compatibility with orders

```

Lemma mult_O_le n m :  $m = 0 \vee n \leq m \times n$ .
Hint Resolve mult_O_le: arith v62.
Lemma mult_le_compat_l n m p :  $n \leq m \rightarrow p \times n \leq p \times m$ .
Hint Resolve mult_le_compat_l: arith.
Lemma mult_le_compat_r n m p :  $n \leq m \rightarrow n \times p \leq m \times p$ .
Lemma mult_le_compat n m p q :  $n \leq m \rightarrow p \leq q \rightarrow n \times p \leq m \times q$ .
Lemma mult_S_lt_compat_l n m p :  $m < p \rightarrow \mathbf{S} \, n \times m < \mathbf{S} \, n \times p$ .
Hint Resolve mult_S_lt_compat_l: arith.
Lemma mult_lt_compat_l n m p :  $n < m \rightarrow 0 < p \rightarrow p \times n < p \times m$ .
Lemma mult_lt_compat_r n m p :  $n < m \rightarrow 0 < p \rightarrow n \times p < m \times p$ .
Lemma mult_S_le_reg_l n m p :  $\mathbf{S} \, n \times m \leq \mathbf{S} \, n \times p \rightarrow m \leq p$ .

```

## 61.4 $n \mapsto 2 \cdot n$ and $n \mapsto 2n+1$ have disjoint image

**Theorem** `odd_even_lem`  $p\ q : 2 \times p + 1 \neq 2 \times q$ .

## 61.5 Tail-recursive mult

*tail\_mult* is an alternative definition for *mult* which is tail-recursive, whereas *mult* is not. This can be useful when extracting programs.

```
Fixpoint mult_acc (s:nat) m n : nat :=
  match n with
  | 0 => s
  | S p => mult_acc (tail_plus m s) m p
  end.
```

**Lemma** `mult_acc_aux` :  $\forall\ n\ m\ p, m + n \times p = \text{mult\_acc}\ m\ p\ n$ .

**Definition** `tail_mult`  $n\ m := \text{mult\_acc}\ 0\ m\ n$ .

**Lemma** `mult_tail_mult` :  $\forall\ n\ m, n \times m = \text{tail\_mult}\ n\ m$ .

*TailSimpl* transforms any *tail\_plus* and *tail\_mult* into *plus* and *mult* and simplify

```
Ltac tail_simpl :=
  repeat rewrite <- plus_tail_plus; repeat rewrite <- mult_tail_mult;
  simpl.
```

## Chapter 62

# Library **Coq.Arith.Peano\_dec**

```
Require Import Decidable PeanoNat.
Require Eqdep_dec.
Local Open Scope nat_scope.
Implicit Types m n x y : nat.
Theorem O_or_S n : {m : nat | S m = n} + {0 = n}.
Notation eq_nat_dec := Nat.eq_dec (compat "8.4").
Hint Resolve O_or_S eq_nat_dec: arith.
Theorem dec_eq_nat n m : decidable (n = m).
Definition UIP_nat:= Eqdep_dec.UIP_dec Nat.eq_dec.
Import EqNotations.
Lemma le_unique:  $\forall m n (le\_mn1\ le\_mn2 : m \leq n), le\_mn1 = le\_mn2$ .
  For compatibility Require Import Le Lt.
```

## Chapter 63

# Library **Coq.Arith.Plus**

Properties of addition.

This file is mostly OBSOLETE now, see module *PeanoNat.Nat* instead.

*Nat.add* is defined in *Init/Nat.v* as:

```
Fixpoint add (n m:nat) : nat :=
  match n with
  | 0 => m
  | S p => S (p + m)
  end
where "n + m" := (add n m) : nat_scope.
```

**Require Import** PeanoNat.

**Local Open Scope** *nat\_scope*.

### 63.1 Neutrality of 0, commutativity, associativity

**Notation** *plus\_0\_l* := *Nat.add\_0\_l* (*compat* "8.4").

**Notation** *plus\_0\_r* := *Nat.add\_0\_r* (*compat* "8.4").

**Notation** *plus\_comm* := *Nat.add\_comm* (*compat* "8.4").

**Notation** *plus\_assoc* := *Nat.add\_assoc* (*compat* "8.4").

**Notation** *plus\_permute* := *Nat.add\_shuffle3* (*compat* "8.4").

**Definition** *plus\_Snm\_nSm* :  $\forall n\ m, S\ n + m = n + S\ m :=$   
*Peano.plus\_n\_Sm*.

**Lemma** *plus\_assoc\_reverse* *n m p* :  $n + m + p = n + (m + p)$ .

### 63.2 Simplification

**Lemma** *plus\_reg\_l* *n m p* :  $p + n = p + m \rightarrow n = m$ .

**Lemma** *plus\_le\_reg\_l* *n m p* :  $p + n \leq p + m \rightarrow n \leq m$ .

**Lemma** *plus\_lt\_reg\_l* *n m p* :  $p + n < p + m \rightarrow n < m$ .

### 63.3 Compatibility with order

Lemma `plus_le_compat_l`  $n\ m\ p : n \leq m \rightarrow p + n \leq p + m$ .  
Lemma `plus_le_compat_r`  $n\ m\ p : n \leq m \rightarrow n + p \leq m + p$ .  
Lemma `plus_lt_compat_l`  $n\ m\ p : n < m \rightarrow p + n < p + m$ .  
Lemma `plus_lt_compat_r`  $n\ m\ p : n < m \rightarrow n + p < m + p$ .  
Lemma `plus_le_compat`  $n\ m\ p\ q : n \leq m \rightarrow p \leq q \rightarrow n + p \leq m + q$ .  
Lemma `plus_le_lt_compat`  $n\ m\ p\ q : n \leq m \rightarrow p < q \rightarrow n + p < m + q$ .  
Lemma `plus_lt_le_compat`  $n\ m\ p\ q : n < m \rightarrow p \leq q \rightarrow n + p < m + q$ .  
Lemma `plus_lt_compat`  $n\ m\ p\ q : n < m \rightarrow p < q \rightarrow n + p < m + q$ .  
Lemma `le_plus_l`  $n\ m : n \leq n + m$ .  
Lemma `le_plus_r`  $n\ m : m \leq n + m$ .  
Theorem `le_plus_trans`  $n\ m\ p : n \leq m \rightarrow n \leq m + p$ .  
Theorem `lt_plus_trans`  $n\ m\ p : n < m \rightarrow n < m + p$ .

### 63.4 Inversion lemmas

Lemma `plus_is_O`  $n\ m : n + m = 0 \rightarrow n = 0 \wedge m = 0$ .  
Definition `plus_is_one`  $m\ n :$   
 $m + n = 1 \rightarrow \{m = 0 \wedge n = 1\} + \{m = 1 \wedge n = 0\}$ .

### 63.5 Derived properties

Notation `plus_permute_2_in_4`  $:= \text{Nat.add\_shuffle1 } (\text{compat } "8.4")$ .

### 63.6 Tail-recursive plus

`tail_plus` is an alternative definition for `plus` which is tail-recursive, whereas `plus` is not. This can be useful when extracting programs.

Fixpoint `tail_plus`  $n\ m : \text{nat} :=$   
  match  $n$  with  
  |  $O \Rightarrow m$   
  |  $S\ n \Rightarrow \text{tail\_plus } n\ (S\ m)$   
end.

Lemma `plus_tail_plus`  $: \forall\ n\ m, n + m = \text{tail\_plus } n\ m$ .

## 63.7 Discrimination

**Lemma** `succ_plus_discr`  $n\ m : n \neq S\ (m+n)$ .

**Lemma** `n_SS`  $n : n \neq S\ (S\ n)$ .

**Lemma** `n_SSS`  $n : n \neq S\ (S\ (S\ n))$ .

**Lemma** `n_SSSS`  $n : n \neq S\ (S\ (S\ (S\ n)))$ .

## 63.8 Compatibility Hints

**Hint Immediate** `plus_comm` : *arith v62*.

**Hint Resolve** `plus_assoc` `plus_assoc_reverse` : *arith v62*.

**Hint Resolve** `plus_le_compat_l` `plus_le_compat_r` : *arith v62*.

**Hint Resolve** `le_plus_l` `le_plus_r` `le_plus_trans` : *arith v62*.

**Hint Immediate** `lt_plus_trans` : *arith v62*.

**Hint Resolve** `plus_lt_compat_l` `plus_lt_compat_r` : *arith v62*.

For compatibility, we “Require” the same files as before

**Require Import** `Le Lt`.

## Chapter 64

# Library `Coq.Arith.Wf_nat`

Well-founded relations and natural numbers

```
Require Import PeanoNat Lt.
```

```
Local Open Scope nat_scope.
```

```
Implicit Types m n p : nat.
```

```
Section Well_founded_Nat.
```

```
Variable A : Type.
```

```
Variable f : A → nat.
```

```
Definition ltof (a b:A) := f a < f b.
```

```
Definition gtof (a b:A) := f b > f a.
```

```
Theorem well_founded_ltof : well_founded ltof.
```

```
Theorem well_founded_gtof : well_founded gtof.
```

It is possible to directly prove the induction principle going back to primitive recursion on natural numbers (*induction\_ltof1*) or to use the previous lemmas to extract a program with a fixpoint (*induction\_ltof2*)

the ML-like program for *induction\_ltof1* is :

```
let induction_ltof1 f F a =
```

```
  let rec indrec n k =
```

```
    match n with
```

```
    | O → error
```

```
    | S m → F k (indrec m)
```

```
in indrec (f a + 1) a
```

the ML-like program for *induction\_ltof2* is :

```
let induction_ltof2 F a = indrec a
```

```
where rec indrec a = F a indrec;;
```

```
Theorem induction_ltof1 :
```

```
  ∀ P:A → Set,
```

```
    (∀ x:A, (∀ y:A, ltof y x → P y) → P x) → ∀ a:A, P a.
```

```
Theorem induction_gtof1 :
```

$\forall P:A \rightarrow \text{Set},$   
 $(\forall x:A, (\forall y:A, \text{gtof } y \ x \rightarrow P \ y) \rightarrow P \ x) \rightarrow \forall a:A, P \ a.$

**Theorem** `induction_ltof2` :

$\forall P:A \rightarrow \text{Set},$   
 $(\forall x:A, (\forall y:A, \text{ltof } y \ x \rightarrow P \ y) \rightarrow P \ x) \rightarrow \forall a:A, P \ a.$

**Theorem** `induction_gtof2` :

$\forall P:A \rightarrow \text{Set},$   
 $(\forall x:A, (\forall y:A, \text{gtof } y \ x \rightarrow P \ y) \rightarrow P \ x) \rightarrow \forall a:A, P \ a.$

If a relation  $R$  is compatible with  $lt$  i.e. if  $x \ R \ y \Rightarrow f(x) < f(y)$  then  $R$  is well-founded.

**Variable**  $R : A \rightarrow A \rightarrow \text{Prop}.$

**Hypothesis**  $H\_compat : \forall x \ y:A, R \ x \ y \rightarrow f \ x < f \ y.$

**Theorem** `well_founded_lt_compat` : `well_founded`  $R.$

**End** `Well_founded_Nat.`

**Lemma** `lt_wf` : `well_founded`  $lt.$

**Lemma** `lt_wf_rec1` :

$\forall n \ (P:\text{nat} \rightarrow \text{Set}), (\forall n, (\forall m, m < n \rightarrow P \ m) \rightarrow P \ n) \rightarrow P \ n.$

**Lemma** `lt_wf_rec` :

$\forall n \ (P:\text{nat} \rightarrow \text{Set}), (\forall n, (\forall m, m < n \rightarrow P \ m) \rightarrow P \ n) \rightarrow P \ n.$

**Lemma** `lt_wf_ind` :

$\forall n \ (P:\text{nat} \rightarrow \text{Prop}), (\forall n, (\forall m, m < n \rightarrow P \ m) \rightarrow P \ n) \rightarrow P \ n.$
